SEPT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPT3 BINDING SITE, designated SEQ ID:21185, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10090] Another function of VGAM128 is therefore inhibition of Septin 3 (SEPT3, Accession NM_019106). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPT3. Solute Carrier Family 12 (potassium/chloride transporters), Member 8 (SLC12A8, Accession NM_024628) is another VGAM128 host target gene. SLC12A8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC12A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A8 BINDING SITE, designated SEQ ID:23894, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10091] Another function of VGAM128 is therefore inhibition of Solute Carrier Family 12 (potassium/chloride transporters), Member 8 (SLC12A8, Accession NM_024628). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A8. LOC115123 (Accession XM_055276) is another VGAM128 host target gene. LOC115123 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115123 BINDING SITE, designated SEQ ID:36248, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10092] Another function of VGAM128 is therefore inhibition of LOC115123 (Accession XM_055276). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115123. LOC116028 (Accession XM_057225) is another VGAM128 host target gene. LOC116028 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC116028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116028 BINDING SITE, designated SEQ ID:36493, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10093] Another function of VGAM128 is therefore inhibition of LOC116028 (Accession XM_057225). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116028. LOC122553 (Accession XM_058630) is another VGAM128 host target gene. LOC122553 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122553 BINDING SITE, designated SEQ ID:36685, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10094] Another function of VGAM128 is therefore inhibition of LOC122553 (Accession XM_058630). Accordingly, utilities

of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122553. LOC145082 (Accession XM_096719) is another VGAM128 host target gene. LOC145082 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145082 BINDING SITE, designated SEQ ID:40494, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10095] Another function of VGAM128 is therefore inhibition of LOC145082 (Accession XM_096719). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145082. LOC145773 (Accession XM_085237) is another VGAM128 host target gene. LOC145773 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145773 BINDING SITE, designated SEQ ID:37985, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10096] Another function of VGAM128 is therefore inhibition of LOC145773 (Accession XM_085237). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145773. LOC146237 (Accession XM_096954) is another VGAM128 host target gene. LOC146237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146237 BINDING SITE, designated SEQ ID:40672, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10097] Another function of VGAM128 is therefore inhibition of LOC146237 (Accession XM_096954). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146237. LOC150319 (Accession XM_086816) is another VGAM128 host target gene. LOC150319 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150319 BINDING SITE, designated SEQ ID:38894, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10098] Another function of VGAM128 is therefore inhibition of LOC150319 (Accession XM_086816). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150319. LOC152348 (Accession XM_098204) is another VGAM128 host target gene. LOC152348 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152348, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152348 BINDING SITE, designated SEQ ID:41488, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10099] Another function of VGAM128 is therefore inhibition of

LOC152348 (Accession XM_098204). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152348. LOC201283 (Accession XM_017132) is another VGAM128 host target gene. LOC201283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201283 BINDING SITE, designated SEQ ID:30303, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10100] Another function of VGAM128 is therefore inhibition of LOC201283 (Accession XM_017132). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201283. LOC91397 (Accession XM_038219) is another VGAM128 host target gene. LOC91397 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC91397 BINDING SITE, designated SEQ ID:32784, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10101] Another function of VGAM128 is therefore inhibition of LOC91397 (Accession XM_038219). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91397. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 129 (VGAM129) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10102] VGAM129 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM129 was detected is described hereinabove with reference to Figs. 1–8.

[10103] VGAM129 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM129 host target gene, herein designated VGAM HOST TARGET GENE,

is a human gene contained in the human genome.

[10104] VGAM129 gene encodes a VGAM129 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM129 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM129 precursor RNA is designated SEQ ID:115, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:115 is located at position 285590 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10105] VGAM129 precursor RNA folds onto itself, forming VGAM129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10106] An enzyme complex designated DICER COMPLEX, `dices` the VGAM129 folded precursor RNA into VGAM129 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM129 RNA is designated SEQ ID:2840, and is provided hereinbelow with reference to the sequence listing part.

[10107] VGAM129 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM129 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM129 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10108] VGAM129 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM129 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM129 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM129 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM129 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10109] The complementary binding of VGAM129 RNA, herein designated VGAM RNA, to host target binding sites on VGAM129 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM129 host target RNA into VGAM129 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[10110] It is appreciated that VGAM129 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM129 host target genes. The mRNA of each one of this plurality of VGAM129 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM129 RNA, herein designated VGAM RNA, and which when bound by VGAM129 RNA causes inhibition of translation of respective one or more VGAM129 host target proteins.

[10111] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM129 gene, herein designated VGAM GENE, on one or more VGAM129 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10112] It is yet further appreciated that a function of VGAM129 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM129 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM129 correlate with, and may be deduced from, the identity of the host target genes which VGAM129 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10113] Nucleotide sequences of the VGAM129 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM129 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM129 are further described hereinbelow with reference to Table 1.

[10114] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM129 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM129 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10115] As mentioned hereinabove with reference to Fig. 1, a function of VGAM129 gene, herein designated VGAM is inhibition of expression of VGAM129 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM129 correlate with, and may be deduced from, the identity of the target genes which VGAM129 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10116] Diaphanous Homolog 2 (Drosophila) (DIAPH2, Accession NM_006729) is a VGAM129 host target gene. DIAPH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIAPH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIAPH2 BINDING SITE, designated SEQ ID:13560, to the

nucleotide sequence of VGAM129 RNA, herein designated VGAM RNA, also designated SEQ ID:2840.

[10117] A function of VGAM129 is therefore inhibition of Diaphanous Homolog 2 (Drosophila) (DIAPH2, Accession NM_006729), a gene which may affect in oogenesis. Accordingly, utilities of VGAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIAPH2. The function of DIAPH2 has been established by previous studies. Mutant alleles of Drosophila dia affect spermatogenesis or oogenesis and lead to sterility. Bione et al. (1998) characterized a human homolog of 'diaphanous' and demonstrated that this gene, designated DIA, is interrupted by a breakpoint in a patient with familial premature ovarian failure (POF; 311360). A human EST, DRES25, which showed significant homology with the Drosophila gene, was mapped to Xq22 by fluorescence in situ hybridization. Bione et al. (1998) found that the human DIA open reading frame encodes a 1,101-amino acid protein approximately 39% identical to the Drosophila protein. Northern blot analysis of human adult and fetal tissues detected 4 transcripts, 3 of which are expressed ubiquitously and the fourth exclusively in adult testis. Bione et al. (1998) showed that the DIA gene

is expressed in developing ovaries and testis of the mouse, as well as in all other tissues, from the E16 stage. Banfi et al. (1997) had indicated that a human homolog of 'diaphanous' maps to Xq22. Lynch et al. (1997) noted that a nonsyndromic form of X-linked deafness, DFN2 (OMIM Ref. No. 304500), also maps to Xq22, making this homologous gene a candidate for DFN2 hearing loss. In the family of patient BC studied by Sala et al. (1997), a balanced X;12 translocation, t(X;12)(q21;p1.3), was associated with premature ovarian failure (OMIM Ref. No. 311360). Patient BC had secondary amenorrhea, with no other associated features, at the age of 17 years. Her mother, who carried the same chromosomal rearrangement, was diagnosed with premature menopause at the age of 32 years. At diagnosis, both mother and daughter had high gonadotropin levels and inactivation of the normal X chromosome (Philippe et al., 1993). The breakpoint was mapped, by FISH, to a specific YAC. The translocation breakpoint was found to be in the last 200-kb intron of the gene.

[10118] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [10119] Bione, S.; Sala, C.; Manzini, C.; Arrigo, G.; Zuffardi, O.; Banfi, S.; Borsani, G.; Jonveaux, P.; Philippe, C.; Zuccotti, M.; Ballabio, A.; Toniolo, D. : A human homologue of the *Drosophila melanogaster* diaphanous gene is disrupted in a patient with premature ovarian failure: evidence for conserved function in oogenesis and implications for human sterility. *Am. J. Hum. Genet.* 62: 533–541, 1998. ; and
- [10120] Philippe, C.; Cremers, F. P. M.; Chery, M.; Bach, I.; Abbadi, N.; Ropers, H. H.; Gilgenkrantz, S. : Physical mapping of DNA markers in the q13–q22 region of the human X chromosome. *Genom.*
- [10121] Further studies establishing the function and utilities of DIAPH2 are found in John Hopkins OMIM database record ID 300108, and in cited publications numbered 9063, 9066, 906 and 9067 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAB36, Member RAS Oncogene Family (RAB36, Accession NM_004914) is another VGAM129 host target gene. RAB36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of RAB36 BINDING SITE, designated SEQ ID:11349, to the nucleotide sequence of VGAM129 RNA, herein designated VGAM RNA, also designated SEQ ID:2840.

[10122] Another function of VGAM129 is therefore inhibition of RAB36, Member RAS Oncogene Family (RAB36, Accession NM_004914), a gene which is involved in protein transport. Accordingly, utilities of VGAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB36. The function of RAB36 has been established by previous studies. Homozygous deletions at chromosome 22q11.2 are a recurrent cytogenetic characteristic of malignant rhabdoid tumors (MRTs), suggesting the presence of a tumor suppressor gene in this region. Mori et al. (1999) constructed a deletion map of the relevant part of 22q11.2 from a panel of 7 MRT cell lines, and isolated a novel gene from the center of the region. The gene, designated RAB36, spans approximately 19 kb of genomic DNA and contains 11 exons. It encodes a deduced 333-amino acid protein that contains 3 phosphate/magnesium-binding motifs, 3 guanine-binding motifs, a tyrosine kinase phosphorylation site, and a C-terminal isoprenylation signal. It shares high amino acid

sequence identity with mouse Rab23 (OMIM Ref. No. 606144) and human RAB13 (OMIM Ref. No. 602672). Northern blot analysis revealed 4.0- and 2.2-kb mRNAs in all human tissues examined. The larger transcript contains a longer 3-prime noncoding sequence. RT-PCR analysis revealed expression of RAB36 mRNAs in 1 MRT cell line and overexpression in 2 others. Direct sequencing of cDNA from these 3 cell lines showed neither nonsense nor frameshift mutations. Moreover, a colony-formation assay indicated that RAB36 is not concerned with cell proliferation or cell death. The authors thus concluded that RAB36 does not have a tumor suppressor function. Immunofluorescence studies localized RAB36 at the Golgi body, suggesting that RAB36, like some other Rab family proteins, is involved in vesicular transport around the Golgi apparatus. By use of exon trapping and large-scale genomic sequence analysis of 2 BAC clones, Zhou et al. (2000) also isolated RAB36, as well as another gene, RTDR1 (OMIM Ref. No. 605663), in the 22q11.2 region. They determined that RAB36 contains 11 exons. They also found no RAB36 mutations in rhabdoid tumor samples.

[10123] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [10124] Mori, T.; Fukuda, Y.; Kuroda, H.; Matsumura, T.; Ota, S.; Sugimoto, T.; Nakamura, Y.; Inazawa, J. : Cloning and characterization of a novel Rab-family gene, Rab36, within the region at 22q11.2 that is homozygously deleted in malignant rhabdoid tumors. *Biochem. Biophys. Res. Commun.* 254: 594–600, 1999. ; and
- [10125] Zhou, J.-Y.; Fogelgren, B.; Wang, Z.; Roe, B. A.; Biegel, J. A. : Isolation of genes from the rhabdoid tumor deletion region in chromosome band 22q11.2. *Gene* 241: 133–141, 2000.
- [10126] Further studies establishing the function and utilities of RAB36 are found in John Hopkins OMIM database record ID 605662, and in cited publications numbered 6412–6413 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sperm Associated Antigen 8 (SPAG8, Accession NM_012436) is another VGAM129 host target gene. SPAG8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPAG8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPAG8 BIND-

ING SITE, designated SEQ ID:14815, to the nucleotide sequence of VGAM129 RNA, herein designated VGAM RNA, also designated SEQ ID:2840.

[10127] Another function of VGAM129 is therefore inhibition of Sperm Associated Antigen 8 (SPAG8, Accession NM_012436), a gene which is a Sperm plasma membrane antigens are attractive antifertility vaccine targets. Accordingly, utilities of VGAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPAG8. The function of SPAG8 has been established by previous studies. Liu et al. (1996) obtained a full-length cDNA encoding SPAG8, which they termed SMP1. Sequence analysis predicted that the 523-amino acid type II transmembrane protein lacks a signal peptide but contains hydrophobic regions near the N and C termini that may function as transmembrane domains. Northern blot analysis detected a 2.45-kb transcript in testis. RT-PCR analysis revealed expression in testis but not in liver or kidney. Western blot analysis showed expression of a 55.5-kD protein, which is very similar to the predicted size. Immunofluorescence microscopy demonstrated expression in the acrosome of the sperm head. Using immunocytochemistry, Miao et al. (1995) found ex-

pression of SPAG8, which they called BS84 (84-kD Beijing sperm), in testis but not in brain, liver, or kidney. RNA dot blot hybridization analysis detected expression in testis but not in heart, brain, lung, or kidney. Autoradiographic analysis detected transcripts in spermatogonia, spermatocytes, and spermatid of seminiferous epithelium

[10128] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10129] Liu, Q.-Y.; Wang, L. F.; Miao, S. Y.; Catterall, J. F. : Expression and characterization of a novel human sperm membrane protein. Biol. Reprod. 54: 323-330, 1996. ; and

[10130] Miao, S.; Yan, Y.; Li, Y.; Bai, Y.; Wei, S.; Zong, C.; Zhao, M.; Zong, S.; Wang, L. : cDNA encoding a human sperm membrane protein BS-84. Prog. Natural Sci. 5: 119-122, 1995.

[10131] Further studies establishing the function and utilities of SPAG8 are found in John Hopkins OMIM database record ID 605731, and in cited publications numbered 6915-6917 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ZER6 (Accession XM_032742) is another VGAM129 host target gene. ZER6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

ZER6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZER6 BINDING SITE, designated SEQ ID:31740, to the nucleotide sequence of VGAM129 RNA, herein designated VGAM RNA, also designated SEQ ID:2840.

[10132] Another function of VGAM129 is therefore inhibition of ZER6 (Accession XM_032742). Accordingly, utilities of VGAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZER6. LOC205795 (Accession XM_120472) is another VGAM129 host target gene. LOC205795 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC205795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205795 BINDING SITE, designated SEQ ID:43610, to the nucleotide sequence of VGAM129 RNA, herein designated VGAM RNA, also designated SEQ ID:2840.

[10133] Another function of VGAM129 is therefore inhibition of LOC205795 (Accession XM_120472). Accordingly, utilities of VGAM129 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC205795. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 130 (VGAM130) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10134] VGAM130 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM130 was detected is described hereinabove with reference to Figs. 1–8.

[10135] VGAM130 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM130 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10136] VGAM130 gene encodes a VGAM130 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM130 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM130 precursor RNA is designated SEQ

ID:116, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:116 is located at position 99873 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10137] VGAM130 precursor RNA folds onto itself, forming VGAM130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10138] An enzyme complex designated DICER COMPLEX, `dices` the VGAM130 folded precursor RNA into VGAM130 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM130 RNA is designated SEQ ID:2841, and

is provided hereinbelow with reference to the sequence listing part.

[10139] VGAM130 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM130 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM130 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[10140] VGAM130 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM130 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM130 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM130 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM130 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10141] The complementary binding of VGAM130 RNA, herein designated VGAM RNA, to host target binding sites on VGAM130 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM130 host target RNA into VGAM130 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10142] It is appreciated that VGAM130 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM130 host target genes. The mRNA of each one of this plurality of VGAM130 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM130 RNA, herein designated VGAM RNA, and which when bound by VGAM130 RNA causes inhibition of translation of respective one or more VGAM130 host target proteins.

[10143] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM130 gene, herein designated VGAM GENE, on one or more VGAM130 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10144] It is yet further appreciated that a function of VGAM130 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM130 correlate with, and may be deduced from, the identity of the host target genes which VGAM130 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10145] Nucleotide sequences of the VGAM130 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM130 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM130 are further described hereinbelow with reference to Table 1.

[10146] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM130 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM130 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10147] As mentioned hereinabove with reference to Fig. 1, a function of VGAM130 gene, herein designated VGAM is inhibition of expression of VGAM130 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM130 correlate with, and may be deduced from, the identity of the target genes which VGAM130 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10148] Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM_023107) is a VGAM130 host target gene. FGFR1 BINDING SITE1 and FGFR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR1 BINDING SITE1 and FGFR1 BINDING SITE2, designated SEQ ID:23364 and SEQ ID:23368 respectively, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:2841.

[10149] A function of VGAM130 is therefore inhibition of Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase

2, Pfeiffer syndrome) (FGFR1, Accession NM_023107). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR1. AOP2 (Accession NM_004905) is another VGAM130 host target gene. AOP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AOP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AOP2 BINDING SITE, designated SEQ ID:11340, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:2841.

[10150] Another function of VGAM130 is therefore inhibition of AOP2 (Accession NM_004905). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AOP2. Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM_086728) is another VGAM130 host target gene. C20orf110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf110 BINDING SITE, designated SEQ ID:38832, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:2841.

[10151] Another function of VGAM130 is therefore inhibition of Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM_086728). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf110. SERP1 (Accession NM_014445) is another VGAM130 host target gene. SERP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERP1 BINDING SITE, designated SEQ ID:15798, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:2841.

[10152] Another function of VGAM130 is therefore inhibition of SERP1 (Accession NM_014445). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SERP1. Zinc Finger Protein 337 (ZNF337, Accession XM_042807) is another VGAM130 host target gene. ZNF337 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF337 BINDING SITE, designated SEQ ID:33771, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:2841.

[10153] Another function of VGAM130 is therefore inhibition of Zinc Finger Protein 337 (ZNF337, Accession XM_042807). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF337. LOC147077 (Accession XM_085699) is another VGAM130 host target gene. LOC147077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147077 BINDING SITE, desig-

nated SEQ ID:38294, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:2841.

[10154] Another function of VGAM130 is therefore inhibition of LOC147077 (Accession XM_085699). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147077. LOC200197 (Accession XM_114148) is another VGAM130 host target gene. LOC200197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200197 BINDING SITE, designated SEQ ID:42733, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:2841.

[10155] Another function of VGAM130 is therefore inhibition of LOC200197 (Accession XM_114148). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200197. LOC253747 (Accession XM_173619) is another VGAM130 host target gene. LOC253747 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253747 BINDING SITE, designated SEQ ID:46552, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:2841.

[10156] Another function of VGAM130 is therefore inhibition of LOC253747 (Accession XM_173619). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253747. LOC86651 (Accession XM_044052) is another VGAM130 host target gene. LOC86651 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC86651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC86651 BINDING SITE, designated SEQ ID:34100, to the nucleotide sequence of VGAM130 RNA, herein designated VGAM RNA, also designated SEQ ID:2841.

[10157] Another function of VGAM130 is therefore inhibition of

LOC86651 (Accession XM_044052). Accordingly, utilities of VGAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC86651. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 131 (VGAM131) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10158] VGAM131 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM131 was detected is described hereinabove with reference to Figs. 1–8.

[10159] VGAM131 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM131 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10160] VGAM131 gene encodes a VGAM131 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM131 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM131 precursor RNA is designated SEQ ID:117, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:117 is located at position 224021 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10161] VGAM131 precursor RNA folds onto itself, forming VGAM131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10162] An enzyme complex designated DICER COMPLEX, `dices` the VGAM131 folded precursor RNA into VGAM131 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 68%) nucleotide sequence of VGAM131 RNA is designated SEQ ID:2842, and is provided hereinbelow with reference to the sequence listing part.

[10163] VGAM131 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM131 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM131 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[10164] VGAM131 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM131 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM131 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM131 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM131 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10165] The complementary binding of VGAM131 RNA, herein designated VGAM RNA, to host target binding sites on VGAM131 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM131 host target RNA into VGAM131 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10166] It is appreciated that VGAM131 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM131 host target genes. The mRNA of each one of this plurality of VGAM131 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM131 RNA, herein designated VGAM RNA, and which when bound by VGAM131 RNA causes inhibition of translation of respective one or more VGAM131 host target proteins.

[10167] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM131 gene, herein designated VGAM GENE, on one or more VGAM131 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10168] It is yet further appreciated that a function of VGAM131 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM131 correlate with, and may be deduced from, the identity of the host target genes which VGAM131 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10169] Nucleotide sequences of the VGAM131 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM131 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM131 are further described hereinbelow with reference to Table 1.

[10170] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM131 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM131 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[10171] As mentioned hereinabove with reference to Fig. 1, a function of VGAM131 gene, herein designated VGAM is inhibition of expression of VGAM131 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM131 correlate with, and may be deduced from, the identity of the target genes which VGAM131 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10172] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 13 (ADAMTS13, Accession NM_139025) is a VGAM131 host target gene. ADAMTS13 BINDING SITE1 through ADAMTS13 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAMTS13, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS13 BINDING SITE1 through ADAMTS13 BINDING SITE3, designated SEQ ID:29124, SEQ ID:29126 and SEQ ID:29128 respectively, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2842.

[10173] A function of VGAM131 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 13 (ADAMTS13, Accession NM_139025), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS13. The function of ADAMTS13 has been established by previous studies. Furlan et al. (1996) and Tsai (1996) independently reported that a metal-containing proteolytic enzyme (metalloprotease) in normal plasma cleaves the peptide bond between tyrosine at position 842 and methionine at position 843 in monomeric subunits of von Willebrand factor (VWF; 193400), thereby degrading the large multimers. This von Willebrand factor-cleaving protease was found by Furlan et al. (1997) to be deficient in 4 patients with chronic relapsing thrombotic thrombocytopenic purpura (OMIM Ref. No. 274150), 2 of whom were brothers. Because no inhibitor of the enzyme was detected in plasma, the deficiency was ascribed to an abnormality in the production, survival, or function of the protease. Furlan et al. (1998) studied plasma sam-

ples from 30 patients with thrombotic thrombocytopenic purpura and 23 patients with the hemolytic-uremic syndrome (HUS; 235400). Of 24 patients with nonfamilial thrombocytopenic purpura, 20 had severe and 4 had moderate protease deficiency during an acute event. An inhibitor of VWF found in 20 of the 24 patients (in all 5 plasma samples tested) was shown to be IgG, i.e., an antibody. Furlan et al. (1998) found that 6 patients with familial thrombocytopenic purpura lacked von Willebrand factor-cleaving protease activity but had no inhibitor, whereas all 10 patients with familial hemolytic-uremic syndrome had normal protease activity. In vitro proteolytic degradation of von Willebrand factor by the protease was studied in 5 patients with familial and 7 patients with nonfamilial hemolytic-uremic syndrome and was found to function normally in all 12 patients. In 2 Japanese families with Upshaw-Schulman syndrome (OMIM Ref. No. 276850), characterized by congenital TTP with neonatal onset and frequent relapses, Kokame et al. (2002) reported 4 novel mutations, 3 missense and 1 nonsense. Comparison of individual ADAMTS13 genotypes and plasma VWFCP activities indicated that 3 of the mutations, arg268 to pro (R268P; 604134.0014), gln449 to ter

(Q449X; 604134.0013), and cys508 to tyr (C508Y; 604134.0015), abrogated activity of the enzyme, whereas the fourth, pro475 to ser (P475S; 604134.0016), retained low but significant activity. The effects of these mutations were further confirmed by expression analysis in HeLa cells. Recombinant VWFCP containing either of the mutations R268P or C508Y was not secreted from cells; in contrast, VWFCP containing either Q449X or P475S was normally secreted but demonstrated minimal activity. Genotype analysis of 364 Japanese subjects revealed that the P475S mutation was heterozygous in 9.6% of individuals, suggesting that approximately 10% of the Japanese population possesses reduced VWFCP activity. Thus, the mutation represents an SNP associated with alterations in VWFCP activity that may be a risk factor for thrombotic disorders.

[10174] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10175] Furlan, M.; Robles, R.; Galbusera, M.; Remuzzi, G.; Kyrle, P. A.; Brenner, B.; Krause, M.; Scharrer, I.; Aumann, V.; Mittler, U.; Solenthaler, M.; Lammle, B. : Von Willebrand factor-cleaving protease in thrombotic thrombocytopenic

purpura and the hemolytic-uremic syndrome. New Eng. J. Med. 339: 1578-1584, 1998. ; and

[10176] Kokame, K.; Matsumoto, M.; Soejima, K.; Yagi, H.; Ishizashi, H.; Funato, M.; Tamai, H.; Konno, M.; Kamide, K.; Kawano, Y.; Miyata, T.; Fujimura, Y. : Mutations and common polymorphisms i.

[10177] Further studies establishing the function and utilities of ADAMTS13 are found in John Hopkins OMIM database record ID 604134, and in cited publications numbered 7412-7413, 9060-9061, 7414-741 and 6027-956 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Huntingtin (Huntington disease) (HD, Accession NM_002111) is another VGAM131 host target gene. HD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:7891, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10178] Another function of VGAM131 is therefore inhibition of

Huntingtin (Huntington disease) (HD, Accession NM_002111). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD. LIM Domain Only 7 (LMO7, Accession NM_005358) is another VGAM131 host target gene. LMO7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LMO7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMO7 BINDING SITE, designated SEQ ID:11826, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10179] Another function of VGAM131 is therefore inhibition of LIM Domain Only 7 (LMO7, Accession NM_005358). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMO7. Membrane Component, Chromosome 11, Surface Marker 1 (M11S1, Accession NM_005898) is another VGAM131 host target gene. M11S1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by M11S1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M11S1 BINDING SITE, designated SEQ ID:12517, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10180] Another function of VGAM131 is therefore inhibition of Membrane Component, Chromosome 11, Surface Marker 1 (M11S1, Accession NM_005898), a gene which may play a role in transporting nutrients from the gut lumen across the gutlining epithelial cell layer. Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with M11S1. The function of M11S1 has been established by previous studies. The apical and basolateral borders of epithelial cells are distinguished by their different protein and lipid components. The sorting of newly synthesized membrane constituents to the appropriate region of the cell is accomplished either in the trans-Golgi network or by transcytosis, the selected transport of proteins to the appropriate surface. Transcytosis also is involved in the internalization of proteins and ligands at one surface and their transport to another. Ellis and Luzio (1995) identified a

protein which undergoes this process by raising antibodies against apical and basolateral membrane fractions prepared from the human intestinal cell line Caco-2 and treated with phosphatidylinositol-specific phospholipase C, an enzyme that cleaves glycosylphosphatidylinositol (GPI) linkages. The antibodies were then used to isolate cDNAs from a human colon carcinoma expression vector library. A composite cDNA sequence was determined that predicts a protein of 649 amino acids which migrates as a 137 kD homodimer; Ellis and Luzio (1995) designated the protein p137(GPI). The protein contains 3 distinct domains. The amino-terminal 275 residues contain several potential alpha helices, the middle region contains proline and glutamine-rich repeats, and residues 469-601 contain a potential GPI anchor site. Northern blots showed 3.4- and 2.7-kb transcripts in all tissues examined except for the testis, where 5.3- and 2.0-kb mRNAs were also observed. Ellis and Luzio (1995) showed that the protein was present at nearly equal amounts in both the apical and basolateral membranes of Caco-2 cells and that the protein appeared first at the basolateral side. Gessler et al. (1996) mapped the gene, designated M11S1, to 11p13 by virtue of their studies of CpG islands in contigs from

the region. The gene, which is adjacent to a CpG island, maps about 300 kb telomeric of CAT (OMIM Ref. No. 115500) and 200 kb centromeric to the LIM-domain only 2 gene (OMIM Ref. No. 180385). The order of transcription is telomere to centromere. Gessler et al. (1996) reported that mouse cDNA clones corresponding to the amino-terminal end of the protein showed that the human and mouse genes share greater than 97% sequence identity.

[10181] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10182] Ellis, J. A.; Luzio, J. P. : Identification and characterization of a novel protein (p137) which transcytoses bidirectionally in Caco-2 cells. J. Biol. Chem. 270: 20717-20723, 1995. ; and

[10183] Gessler, M.; Klamt, B.; Tsaoussidou, S.; Ellis, J. A.; Luzio, J. P. : The gene encoding the GPI-anchored membrane protein p137(GPI) (M11S1) maps to human chromosome 11p13 and is highly cons.

[10184] Further studies establishing the function and utilities of M11S1 are found in John Hopkins OMIM database record ID 601178, and in cited publications numbered

9318–9319 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphodiesterase 1A, Calmodulin-dependent (PDE1A, Accession NM_005019) is another VGAM131 host target gene. PDE1A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PDE1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE1A BINDING SITE, designated SEQ ID:11457, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10185] Another function of VGAM131 is therefore inhibition of Phosphodiesterase 1A, Calmodulin-dependent (PDE1A, Accession NM_005019), a gene which is a Ca^{2+} -calmodulin dependent cyclic nucleotide phosphodiesterase and has a higher affinity for cGMP than for cAMP. Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE1A. The function of PDE1A has been established by previous studies. Phosphodiesterase 1 is a membrane-bound exonuclease that hydrolyzes phospho-

diester bonds. See 171885. Wilson and McKenna (1988) examined the segregation of the gene for human phosphodiesterase 1A in human-rodent somatic cell hybrids. Electrophoretic analysis of phosphodiesterase 1A in hybrids suggested that the enzyme is a monomer. The PDE1A gene segregated concordantly with human chromosome 4 in all but 1 of 26 hybrids examined and showed 4 or more instances of discordance with all other chromosomes. By screening a hippocampus library with a bovine 61-kD CaM PDE cDNA, Loughney et al. (1996) isolated cDNAs encoding PDE1A (HCAM1) and PDE1C (HCAM3; 602987). The sequence of the predicted 535-amino acid protein is 94% identical to that of the bovine 61-kD CaM PDE when 2 short regions unique to PDE1A are excluded from comparison. Northern blot analysis revealed tissue-specific expression of 4.8-, 2.4-, and 2.6-kb PDE1A mRNAs, with transcripts most abundant in brain, heart, kidney, and skeletal muscle. Although expression of full-length PDE1A in *S. cerevisiae* did not result in PDE activity, an amino-truncated protein gave measurable PDE activity with higher affinity for cGMP than for cAMP.

[10186] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [10187] Loughney, K.; Martins, T. J.; Harris, E. A. S.; Sadhu, K.; Hicks, J. B.; Sonnenburg, W. K.; Beavo, J. A.; Ferguson, K. : Isolation and characterization of cDNAs corresponding to two human calcium, calmodulin-regulated, 3-prime,5-prime-cyclic nucleotide phosphodiesterases. J. Biol. Chem. 271: 796-806, 1996. ; and

- [10189] Further studies establishing the function and utilities of PDE1A are found in John Hopkins OMIM database record ID 171890, and in cited publications numbered 12446-12447 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pituitary Tumor-transforming 1 Interacting Protein (PTTG1IP, Accession NM_004339) is another VGAM131 host target gene. PTTG1IP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTTG1IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PTTG1IP BINDING SITE, designated SEQ ID:10535, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10190] Another function of VGAM131 is therefore inhibition of Pituitary Tumor-transforming 1 Interacting Protein (PTTG1IP, Accession NM_004339), a gene which facilitates the translocation of PTTG to the nucleus. Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTTG1IP. The function of PTTG1IP has been established by previous studies. In the course of constructing a transcript map for chromosome 21, Yaspo et al. (1995) isolated numerous coding segments from 21q22.3, including transcription unit TU6. Yaspo et al. (1998) cloned cDNAs corresponding to TU6 by screening a human fetal thymus cDNA library with a partial cDNA and trapped exon from TU6. Homology searches of sequence databases using the translated sequence did not detect similarities to known proteins, and the authors named the novel gene C21ORF3. The predicted 180-amino acid C21ORF3 protein has features of a type Ia integral membrane protein and contains the tetrapeptide YXRF, a motif

observed in proteins internalized via coated pit-mediated endocytosis. Northern blot analysis detected a 2.69-kb C21ORF3 mRNA in all tissues examined. Using a yeast 2-hybrid screen on a human testis cDNA library with rat pituitary tumor-transforming gene (PTTG; 604147) as bait, Chien and Pei (2000) isolated a cDNA encoding PTTG1IP, which they called PBF (PTTG-binding factor). Sequence analysis predicted that the 179-amino acid PBF protein, which is 92% identical to C21ORF3, contains multiple phosphorylation sites, 5 potential N- and O-glycosylation sites, a potential N-terminal sorting signal, and a C-terminal nuclear localization signal (NLS). Northern and dot blot analysis detected a 2.8-kb PBF transcript in all tissues tested, with highest expression in placenta. Pull-down and coimmunoprecipitation analyses showed that PBF and PTTG interact specifically via their C-terminal regions. Western blot analysis and immunofluorescence microscopy showed that whereas PTTG is expressed primarily in the cytoplasm, PBF is expressed in both the cytoplasm and nucleus. The authors demonstrated that PBF, via its NLS, facilitates the translocation of PTTG to the nucleus. Reporter assay analysis indicated that coexpression of PBF and PTTG induces transcription of basic fibroblast

growth factor (FGF2; 134920).

[10191] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10192] Yaspo, M.-L.; Aaltonen, J.; Horelli-Kuitunen, N.; Peltonen, L.; Lehrach, H. : Cloning of a novel human putative type Ia integral membrane protein mapping to 21q22.3. *Genomics* 49: 133–136, 1998. ; and

[10193] Yaspo, M.-L.; Gellen, L.; Mott, R.; Korn, B.; Nizetic, D.; Poustka, A. M.; Lehrach, H. : Model for a transcript map of human chromosome 21: isolation of new coding sequences from exon an.

[10194] Further studies establishing the function and utilities of PTTG1IP are found in John Hopkins OMIM database record ID 603784, and in cited publications numbered 8194–8196 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAB36, Member RAS Oncogene Family (RAB36, Accession NM_004914) is another VGAM131 host target gene. RAB36 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of RAB36 BINDING SITE, designated SEQ ID:11348, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10195] Another function of VGAM131 is therefore inhibition of RAB36, Member RAS Oncogene Family (RAB36, Accession NM_004914), a gene which is involved in protein transport. Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB36. The function of RAB36 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM129. Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM_003242) is another VGAM131 host target gene. TGFB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB2 BINDING SITE, designated SEQ ID:9238, to the nucleotide sequence

of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10196] Another function of VGAM131 is therefore inhibition of Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM_003242). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB2. 7h3 (Accession NM_033025) is another VGAM131 host target gene. 7h3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by 7h3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of 7h3 BINDING SITE, designated SEQ ID:26915, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10197] Another function of VGAM131 is therefore inhibition of 7h3 (Accession NM_033025). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with 7h3. DKFZp547C176 (Accession XM_040799) is another VGAM131 host target gene. DKFZp547C176 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547C176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547C176 BINDING SITE, designated SEQ ID:33381, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10198] Another function of VGAM131 is therefore inhibition of DKFZp547C176 (Accession XM_040799). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547C176. DKFZp586I021 (Accession NM_032271) is another VGAM131 host target gene. DKFZp586I021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp586I021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp586I021 BINDING SITE, designated SEQ ID:26019, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10199] Another function of VGAM131 is therefore inhibition of DKFZp586I021 (Accession NM_032271). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586I021. Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM_047295) is another VGAM131 host target gene. EPB41L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPB41L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB41L1 BINDING SITE, designated SEQ ID:34936, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10200] Another function of VGAM131 is therefore inhibition of Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM_047295). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L1. FLJ10540 (Accession NM_018131) is another VGAM131 host target gene. FLJ10540 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by FLJ10540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10540 BINDING SITE, designated SEQ ID:19927, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10201] Another function of VGAM131 is therefore inhibition of FLJ10540 (Accession NM_018131). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10540. H11 (Accession NM_014365) is another VGAM131 host target gene. H11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H11 BINDING SITE, designated SEQ ID:15691, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10202] Another function of VGAM131 is therefore inhibition of H11 (Accession NM_014365). Accordingly, utilities of

VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H11.

HYA22 (Accession NM_005808) is another VGAM131 host target gene. HYA22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HYA22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HYA22 BINDING SITE, designated SEQ ID:12387, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10203] Another function of VGAM131 is therefore inhibition of HYA22 (Accession NM_005808). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYA22. KIAA0553 (Accession XM_045981) is another VGAM131 host target gene. KIAA0553 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0553 BINDING SITE,

designated SEQ ID:34634, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10204] Another function of VGAM131 is therefore inhibition of KIAA0553 (Accession XM_045981). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0553. KIAA0828 (Accession XM_088105) is another VGAM131 host target gene. KIAA0828 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0828 BINDING SITE, designated SEQ ID:39510, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10205] Another function of VGAM131 is therefore inhibition of KIAA0828 (Accession XM_088105). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0828. KIAA1522 (Accession XM_036299) is another VGAM131 host target gene. KIAA1522 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1522 BINDING SITE, designated SEQ ID:32418, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10206] Another function of VGAM131 is therefore inhibition of KIAA1522 (Accession XM_036299). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1522. KIAA1560 (Accession XM_034422) is another VGAM131 host target gene. KIAA1560 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1560 BINDING SITE, designated SEQ ID:32100, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10207] Another function of VGAM131 is therefore inhibition of KIAA1560 (Accession XM_034422). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1560. MGC13105 (Accession XM_049394) is another VGAM131 host target gene. MGC13105 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13105, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13105 BINDING SITE, designated SEQ ID:35406, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10208] Another function of VGAM131 is therefore inhibition of MGC13105 (Accession XM_049394). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13105. MGC32043 (Accession NM_144582) is another VGAM131 host target gene. MGC32043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC32043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32043 BINDING SITE, designated SEQ ID:29392, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10209] Another function of VGAM131 is therefore inhibition of MGC32043 (Accession NM_144582). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC32043. Neuronal Pentraxin Receptor (NPTXR, Accession NM_058178) is another VGAM131 host target gene. NPTXR BINDING SITE1 and NPTXR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NPTXR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTXR BINDING SITE1 and NPTXR BINDING SITE2, designated SEQ ID:27736 and SEQ ID:15588 respectively, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10210] Another function of VGAM131 is therefore inhibition of Neuronal Pentraxin Receptor (NPTXR, Accession NM_058178). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTXR. LOC149837 (Accession XM_097747) is another VGAM131 host target gene. LOC149837 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC149837 BINDING SITE, designated SEQ ID:41097, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10211] Another function of VGAM131 is therefore inhibition of LOC149837 (Accession XM_097747). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149837. LOC150605 (Accession XM_097927) is another VGAM131 host target gene. LOC150605 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150605, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150605 BINDING SITE, designated SEQ ID:41231, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10212] Another function of VGAM131 is therefore inhibition of LOC150605 (Accession XM_097927). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150605. LOC155064 (Accession XM_088128) is an-

other VGAM131 host target gene. LOC155064 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155064, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155064 BINDING SITE, designated SEQ ID:39531, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10213] Another function of VGAM131 is therefore inhibition of LOC155064 (Accession XM_088128). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155064. LOC160156 (Accession XM_090047) is another VGAM131 host target gene. LOC160156 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC160156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160156 BINDING SITE, designated SEQ ID:39990, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10214] Another function of VGAM131 is therefore inhibition of LOC160156 (Accession XM_090047). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160156. LOC197201 (Accession XM_113839) is another VGAM131 host target gene. LOC197201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197201 BINDING SITE, designated SEQ ID:42463, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10215] Another function of VGAM131 is therefore inhibition of LOC197201 (Accession XM_113839). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197201. LOC91960 (Accession XM_041872) is another VGAM131 host target gene. LOC91960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91960, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91960 BINDING SITE, designated SEQ ID:33608, to the nucleotide sequence of VGAM131 RNA, herein designated VGAM RNA, also designated SEQ ID:2842.

[10216] Another function of VGAM131 is therefore inhibition of LOC91960 (Accession XM_041872). Accordingly, utilities of VGAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91960. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 132 (VGAM132) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10217] VGAM132 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM132 was detected is described hereinabove with reference to Figs. 1–8.

[10218] VGAM132 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM132 host

target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10219] VGAM132 gene encodes a VGAM132 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM132 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM132 precursor RNA is designated SEQ ID:118, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:118 is located at position 44993 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10220] VGAM132 precursor RNA folds onto itself, forming VGAM132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10221] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM132 folded precursor RNA into VGAM132 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM132 RNA is designated SEQ ID:2843, and is provided hereinbelow with reference to the sequence listing part.

[10222] VGAM132 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM132 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM132 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10223] VGAM132 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM132 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM132 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM132 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM132 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10224] The complementary binding of VGAM132 RNA, herein designated VGAM RNA, to host target binding sites on VGAM132 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM132 host target RNA into VGAM132 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10225] It is appreciated that VGAM132 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM132 host target genes. The mRNA of each one of this plurality of VGAM132 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM132 RNA, herein designated VGAM RNA, and which when bound by VGAM132 RNA causes inhibition of translation of respective one or more VGAM132 host target proteins.

[10226] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM132 gene, herein designated VGAM GENE, on one or more VGAM132 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10227] It is yet further appreciated that a function of VGAM132 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM132 correlate with, and may be deduced from, the identity of the host target genes which VGAM132 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10228] Nucleotide sequences of the VGAM132 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM132 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM132 are further

described hereinbelow with reference to Table 1.

[10229] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM132 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM132 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10230] As mentioned hereinabove with reference to Fig. 1, a function of VGAM132 gene, herein designated VGAM is inhibition of expression of VGAM132 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM132 correlate with, and may be deduced from, the identity of the target genes which VGAM132 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10231] G Protein-coupled Receptor 81 (GPR81, Accession NM_032554) is a VGAM132 host target gene. GPR81 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR81, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of GPR81 BINDING SITE, designated SEQ ID:26280, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10232] A function of VGAM132 is therefore inhibition of G Protein-coupled Receptor 81 (GPR81, Accession NM_032554). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR81. Major Histocompatibility Complex, Class II, DQ Alpha 1 (HLA-DQA1, Accession XM_175260) is another VGAM132 host target gene. HLA-DQA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HLA-DQA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLA-DQA1 BINDING SITE, designated SEQ ID:46724, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10233] Another function of VGAM132 is therefore inhibition of Major Histocompatibility Complex, Class II, DQ Alpha 1 (HLA-DQA1, Accession XM_175260), a gene which is alpha 1 chain of HLA-DQ1 class II molecule (Ia antigen)

which binds peptides and presents them to CD4+ T lymphocytes. Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLA-DQA1. The function of HLA-DQA1 has been established by previous studies. In multiple sclerosis patients, it showed the same frequency as in the normal population. Todd et al. (1987) presented a map of the class II loci. They suggested that the structure of the DQ molecule, in particular residue 57 of the beta-chain, specifies the autoimmune response against insulin-producing islet cells that leads to insulin-dependent diabetes mellitus (IDDM; 222100). Of the approximately 14 class II HLA genes within the HLA-D region, the DQ3.2-beta gene accounts for the well-documented association of HLA-DR4 with insulin-dependent diabetes mellitus and is the single allele most highly correlated with this disease. Kwok et al. (1989) found that amino acid 45 was critical for generating serologic epitopes characterizing the DQ3.2-beta gene and its nondiabetic allele, DQ3.1-beta. Todd et al. (1990) found that in Japanese, IDDM was more strongly associated with HLA-DQ than with HLA-DR; that the A3 allele at the DQA1 locus was most strongly associated with disease; that the

DQw8 allele of the DQB1 locus, which is associated with susceptibility to type I diabetes in Caucasians and Blacks, was not increased in frequency in Japanese patients; and that asp57–encoding DQB1 alleles, which are associated with reduced susceptibility to type I diabetes in Caucasians, was present in all except 1 of 49 Japanese patients and in all of 31 controls, in at least heterozygous state. Forty percent of patients were homozygous for asp57–encoding DQB1 alleles versus 35% of controls. The high frequency of asp57–encoding DQB1 alleles in Japanese may account for the rarity of type I diabetes in Japan. Animal model experiments lend further support to the function of HLA–DQA1. Studies supporting a role for HLA–DQ polymorphism in human rheumatoid arthritis were supported by Nabozny et al. (1996) and Bradley et al. (1997). Nabozny et al. (1996) demonstrated that mice transgenic for HLA–DQ8, a DQ allele associated with susceptibility to RA, developed severe arthritis after type II collagen immunization. Bradley et al. (1997) generated mice transgenic for HLA–DQ6, an allele associated with a nonsusceptible haplotype, and found that the DQ6 mice were resistant to collagen–induced arthritis. They also assessed the combined effect of an RA–susceptible and an

RA-nonassociated DQ allele by producing double-transgenic mice expressing both DQ6 and DQ8 molecules, representing the more prevalent condition found in humans where heterozygosity at the DQ allele is common. The double-transgenic mice developed moderate collagen-induced arthritis when immunized with type II collagen as compared with the severe arthritis observed in DQ8 transgenic mice, much like RA patients bearing both susceptible and nonsusceptible HLA haplotypes.

[10234] It is appreciated that the abovementioned animal model for HLA-DQA1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[10235] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10236] Todd, J. A.; Fukui, Y.; Kitagawa, T.; Sasazuki, T. : The A3 allele of the HLA-DQA1 locus is associated with susceptibility to type 1 diabetes in Japanese. Proc. Nat. Acad. Sci. 87: 1094-1098, 1990. ; and

[10237] Bradley, D. S.; Nabozny, G. H.; Cheng, S.; Zhou, P.; Griffiths, M. M.; Luthra, H. S.; David, C. S. : HLA-DQB1 polymorphism determines incidence, onset, and severity of

collagen-induced a.

[10238] Further studies establishing the function and utilities of HLA-DQA1 are found in John Hopkins OMIM database record ID 146880, and in cited publications numbered 4206-113, 3296-126, 1144 and 288-293 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 1 (MAP3K7IP1, Accession NM_006116) is another VGAM132 host target gene. MAP3K7IP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP3K7IP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K7IP1 BINDING SITE, designated SEQ ID:12762, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10239] Another function of VGAM132 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 1 (MAP3K7IP1, Accession NM_006116), a gene which may be an important signaling intermediate between tgfb receptors and map3k7/tak1. Accordingly,

utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K7IP1. The function of MAP3K7IP1 has been established by previous studies. Shibuya et al. (1996) used the yeast 2-hybrid system to identify brain cDNAs encoding proteins that interacted with TAK1 (OMIM Ref. No. 602614). They recovered a gene encoding a predicted 504-amino acid protein that they named TAB1 (TAK1-binding protein-1). On Northern blots, TAB1 was expressed as a 3.5-kb mRNA in all tissues tested Shibuya et al. (1996) found that in both yeast and mammalian cells, TAB1 activated the kinase activity of TAK1 by direct interaction. They showed that the C-terminal 68 amino acids of TAB1 are sufficient for binding and activation of TAK1 in mammalian cells, while the N-terminal 418 amino acids act as a dominant-negative inhibitor of transforming growth factor-beta (TGFB; 190180)-induced gene expression. Since TAK1 functions as an MAPKKK in the TGFB signaling pathway, Shibuya et al. (1996) suggested that TAB1 may be an important signaling intermediate between TGFB receptors and TAK1

[10240] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[10241] Shibuya, H.; Yamaguchi, K.; Shirakabe, K.; Tonegawa, A.; Gotoh, Y.; Ueno, N.; Irie, K.; Nishida, E.; Matsumoto, K. : TAB1: an activator of the TAK1 MAPKKK in TGF-beta signal transduction. Science 272: 1179-1182, 1996. ; and

[10242] Shibuya, H.; Yamaguchi, K.; Shirakabe, K.; Tonegawa, A.; Gotoh, Y.; Ueno, N.; Irie, K.; Nishida, E.; Matsumoto, K. : TAB1: an activator of the TAK1 MAPKKK in TGF-beta signal transduction. S.

[10243] Further studies establishing the function and utilities of MAP3K7IP1 are found in John Hopkins OMIM database record ID 602615, and in cited publications numbered 10124 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear Factor Related to Kappa B Binding Protein (NFRKB, Accession NM_006165) is another VGAM132 host target gene. NFRKB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NFRKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFRKB BINDING SITE, designated SEQ ID:12819, to the nucleotide sequence of VGAM132 RNA,

herein designated VGAM RNA, also designated SEQ ID:2843.

[10244] Another function of VGAM132 is therefore inhibition of Nuclear Factor Related to Kappa B Binding Protein (NFRKB, Accession NM_006165). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFRKB. PCTAIRE Protein Kinase 3 (PCTK3, Accession XM_053746) is another VGAM132 host target gene. PCTK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCTK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCTK3 BINDING SITE, designated SEQ ID:36123, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10245] Another function of VGAM132 is therefore inhibition of PCTAIRE Protein Kinase 3 (PCTK3, Accession XM_053746), a gene which may play a role in signal transduction cascades in terminally differentiated cells. Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PCTK3. The function of PCTK3 has been established by previous studies. The PCTAIRE protein kinases comprise a distinct subfamily of the CDC2 (OMIM Ref. No. 116940)-related serine/threonine-specific protein kinases. See PCTK1 (OMIM Ref. No. 311550). Meyerson et al. (1992) isolated a partial cDNA encoding PCTAIRE3. Like other members of the PCTAIRE subfamily, the predicted PCTAIRE3 protein contains an N-terminal extension relative to CDC2. The CDC2-related region of PCTAIRE3, excluding the N-terminal extension, shares 51%, 79%, and 80% protein sequence identity with CDC2, PCTK1, and PCTK2 (OMIM Ref. No. 603440), respectively. Northern blot analysis revealed that PCTAIRE3 is expressed in a variety of human cell lines and tissues. Okuda et al. (1992) identified the mouse homolog of PCTK3. By fluorescence in situ hybridization, Okuda et al. (1994) mapped the PCTK3 gene to 1q31-q32.

[10246] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10247] Meyerson, M.; Enders, G. H.; Wu, C.-L.; Su, L.-K.; Gorka, C.; Nelson, C.; Harlow, E.; Tsai, L.-H. : A family of human cdc2-related protein kinases. EMBO J. 11: 2909-2917,

1992. ; and

[10248] Okuda, T.; Cleveland, J. L.; Downing, J. R. : PCTAIRE-1 and PCTAIRE-3, two members of a novel cdc2/CDC28-related protein kinase gene family. *Oncogene* 7: 2249-2258, 1992.

[10249] Further studies establishing the function and utilities of PCK3 are found in John Hopkins OMIM database record ID 169190, and in cited publications numbered 15 and 3501-3502 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Paxillin (PXN, Accession NM_002859) is another VGAM132 host target gene. PXN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PXN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXN BINDING SITE, designated SEQ ID:8755, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10250] Another function of VGAM132 is therefore inhibition of Paxillin (PXN, Accession NM_002859), a gene which may be involved in p53-dependent apoptosis. Accordingly, utilities of VGAM132 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with PXN. The function of PXN has been established by previous studies. *Drosophila* peroxidase is an extracellular matrix-associated peroxidase. It is expressed exclusively in hemocytes derived from head mesoderm at a very early stage of differentiation. Peroxidase exists as a homotrimer with a unique hybrid structure that combines an enzymatically functional peroxidase domain with motifs that are typically found in extracellular matrix-associated proteins. It is a secreted protein that contains a secretory recognition sequence at its N terminus. Peroxidase catalyzes hydrogen peroxide-driven radioiodination, oxidations, and the formation of dityrosine in vitro. It is also thought to function in extracellular matrix consolidation, phagocytosis, and defense. By sequencing random cDNAs corresponding to relatively long transcripts from the human immature myeloid cell line KG-1, Nagase et al. (1996) identified a cDNA, which they called KIAA0230, that encodes PRG2. The cDNA represents at least 90% of the full-length PRG2 transcript; however, since it lacks an inframe stop codon upstream of the first ATG, it may be missing 5-prime coding sequence. The 1,496-amino acid PRG2 protein deduced from the cDNA sequence contains

predicted transmembrane domains. PRG2 shares 38% amino acid sequence identity with *Drosophila* peroxidase across 1,412 amino acids. Northern blot analysis of human tissues showed PRG2 expression at higher levels in heart, lung, ovary, and placenta, and lower levels in liver, small intestine, colon, pancreas, spleen, kidney, thymus, skeletal muscle, testis, and prostate; PRG2 expression was not detected in brain or peripheral blood leukocytes.

[10251] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10252] Horikoshi, N.; Cong, J.; Kley, N.; Shenk, T. : Isolation of differentially expressed cDNAs from p53-dependent apoptotic cells: activation of the human homologue of the *Drosophila* peroxidase gene. *Biochem. Biophys. Res. Commun.* 261: 864–869, 1999. ; and

[10253] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kawarabayashi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human g.

[10254] Further studies establishing the function and utilities of PXN are found in John Hopkins OMIM database record ID 605158, and in cited publications numbered 439 and

9379 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAD50 Homolog (*S. cerevisiae*) (RAD50, Accession NM_005732) is another VGAM132 host target gene. RAD50 BINDING SITE1 and RAD50 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD50, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD50 BINDING SITE1 and RAD50 BINDING SITE2, designated SEQ ID:12294 and SEQ ID:28551 respectively, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10255] Another function of VGAM132 is therefore inhibition of RAD50 Homolog (*S. cerevisiae*) (RAD50, Accession NM_005732), a gene which is involved in dna double-strand break repair (dsbr). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD50. The function of RAD50 has been established by previous studies. The *S. cerevisiae* Rad50 gene encodes a protein that is essential for double-stranded DNA break repair by

nonhomologous DNA end joining and chromosomal integration. The yeast Rad50, Mre11 (OMIM Ref. No. 600814), and Xrs2 proteins appear to act in a multiprotein complex, consistent with the observation that mutations in these genes confer nearly identical phenotypes of no meiotic recombination and elevated rates of homologous mitotic recombination. By direct selection of cDNAs from the 5q23–q31 chromosomal interval, Dolganov et al. (1996) isolated a cDNA encoding a human Rad50 homolog. The human RAD50 gene spans 100 to 130 kb. Northern blot analysis revealed that the RAD50 gene was expressed as a 5.5–kb mRNA predominantly in testis. A faint 7–kb transcript, which the authors considered to be an mRNA with an alternatively processed 3–prime end, was also detected. Yeast Rad50 and the predicted 1,312–amino acid human RAD50 protein share more than 50% identity in their N– and C–termini. The central heptad repeat domains of the proteins have relatively divergent primary sequences but are predicted to adopt very similar coiled-coil structures. Using immunoprecipitation, Dolganov et al. (1996) demonstrated that the 153–kD RAD50 is stably associated with MRE11 in a protein complex, which may also include proteins of 95 kD, 200 kD, and 350 kD. By

inclusion within mapped clones and by analysis of somatic cell hybrids, Dolganov et al. (1996) mapped the RAD50 gene to 5q31. They suggested that a recombinational DNA repair deficiency may be associated with the development of myeloid leukemia, since this chromosomal region is frequently altered in acute myeloid leukemia and myelodysplastic disease.

[10256] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10257] Dolganov, G. M.; Maser, R. S.; Novikov, A.; Tosto, L.; Chong, S.; Bressan, D. A.; Petrini, J. H. J. : Human Rad50 is physically associated with human Mre11: identification of a conserved multiprotein complex implicated in recombinational DNA repair. *Molec. [10259] Further studies establishing the function and utilities of RAD50 are found in John Hopkins OMIM database record ID 604040, and in cited publications numbered 9233–8204, 7143, 8205, 820 and 7145–7146 listed in

the bibliography section hereinbelow, which are also hereby incorporated by reference. CXYorf1 (Accession XM_088704) is another VGAM132 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:39904, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10260] Another function of VGAM132 is therefore inhibition of CXYorf1 (Accession XM_088704). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. FLJ00060 (Accession XM_028154) is another VGAM132 host target gene. FLJ00060 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00060 BINDING SITE,

designated SEQ ID:30628, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10261] Another function of VGAM132 is therefore inhibition of FLJ00060 (Accession XM_028154). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00060. FLJ10244 (Accession NM_018037) is another VGAM132 host target gene. FLJ10244 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10244, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10244 BINDING SITE, designated SEQ ID:19779, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10262] Another function of VGAM132 is therefore inhibition of FLJ10244 (Accession NM_018037). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10244. FLJ20257 (Accession NM_019606) is another VGAM132 host target gene. FLJ20257 BINDING SITE is HOST TARGET

binding site found in the 5' untranslated region of mRNA encoded by FLJ20257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20257 BINDING SITE, designated SEQ ID:21220, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10263] Another function of VGAM132 is therefore inhibition of FLJ20257 (Accession NM_019606). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20257. FLJ31951 (Accession NM_144726) is another VGAM132 host target gene. FLJ31951 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31951 BINDING SITE, designated SEQ ID:29550, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10264] Another function of VGAM132 is therefore inhibition of

FLJ31951 (Accession NM_144726). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31951. KIAA1001 (Accession NM_014960) is another VGAM132 host target gene. KIAA1001 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1001 BINDING SITE, designated SEQ ID:17325, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10265] Another function of VGAM132 is therefore inhibition of KIAA1001 (Accession NM_014960). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1001. KIAA1321 (Accession XM_030856) is another VGAM132 host target gene. KIAA1321 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1321 BINDING SITE, designated SEQ ID:31192, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10266] Another function of VGAM132 is therefore inhibition of KIAA1321 (Accession XM_030856). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1321. PRO2435 (Accession NM_018527) is another VGAM132 host target gene. PRO2435 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2435 BINDING SITE, designated SEQ ID:20600, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10267] Another function of VGAM132 is therefore inhibition of PRO2435 (Accession NM_018527). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2435. Proline Rich 2 (PROL2, Accession NM_006813) is another

VGAM132 host target gene. PROL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PROL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROL2 BINDING SITE, designated SEQ ID:13684, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10268] Another function of VGAM132 is therefore inhibition of Proline Rich 2 (PROL2, Accession NM_006813). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROL2. Trans-golgi Network Protein 2 (TGOLN2, Accession XM_034215) is another VGAM132 host target gene. TGOLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGOLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGOLN2 BINDING SITE, designated SEQ ID:32022, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ

ID:2843.

[10269] Another function of VGAM132 is therefore inhibition of Trans-golgi Network Protein 2 (TGOLN2, Accession XM_034215). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGOLN2. LOC126917 (Accession XM_059091) is another VGAM132 host target gene. LOC126917 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126917 BINDING SITE, designated SEQ ID:36867, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10270] Another function of VGAM132 is therefore inhibition of LOC126917 (Accession XM_059091). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126917. LOC144866 (Accession XM_096699) is another VGAM132 host target gene. LOC144866 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC144866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144866 BINDING SITE, designated SEQ ID:40479, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10271] Another function of VGAM132 is therefore inhibition of LOC144866 (Accession XM_096699). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144866. LOC145739 (Accession XM_085222) is another VGAM132 host target gene. LOC145739 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145739 BINDING SITE, designated SEQ ID:37962, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10272] Another function of VGAM132 is therefore inhibition of LOC145739 (Accession XM_085222). Accordingly, utilities

of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145739. LOC146287 (Accession XM_096967) is another VGAM132 host target gene. LOC146287 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146287 BINDING SITE, designated SEQ ID:40691, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10273] Another function of VGAM132 is therefore inhibition of LOC146287 (Accession XM_096967). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146287. LOC149842 (Accession XM_097745) is another VGAM132 host target gene. LOC149842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC149842 BINDING SITE, designated SEQ ID:41090, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10274] Another function of VGAM132 is therefore inhibition of LOC149842 (Accession XM_097745). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149842. LOC150951 (Accession XM_097975) is another VGAM132 host target gene. LOC150951 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150951 BINDING SITE, designated SEQ ID:41277, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10275] Another function of VGAM132 is therefore inhibition of LOC150951 (Accession XM_097975). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150951. LOC153277 (Accession XM_098346) is another VGAM132 host target gene. LOC153277 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153277 BINDING SITE, designated SEQ ID:41604, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10276] Another function of VGAM132 is therefore inhibition of LOC153277 (Accession XM_098346). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153277. LOC153727 (Accession XM_098422) is another VGAM132 host target gene. LOC153727 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153727 BINDING SITE, designated SEQ ID:41680, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10277] Another function of VGAM132 is therefore inhibition of

LOC153727 (Accession XM_098422). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153727. LOC220883 (Accession XM_166076) is another VGAM132 host target gene. LOC220883 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220883, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220883 BINDING SITE, designated SEQ ID:43849, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10278] Another function of VGAM132 is therefore inhibition of LOC220883 (Accession XM_166076). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220883. LOC221662 (Accession XM_166466) is another VGAM132 host target gene. LOC221662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC221662 BINDING SITE, designated SEQ ID:44387, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10279] Another function of VGAM132 is therefore inhibition of LOC221662 (Accession XM_166466). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221662. LOC257484 (Accession XM_114232) is another VGAM132 host target gene. LOC257484 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257484, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257484 BINDING SITE, designated SEQ ID:42813, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10280] Another function of VGAM132 is therefore inhibition of LOC257484 (Accession XM_114232). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257484. LOC92539 (Accession XM_045632) is an-

other VGAM132 host target gene. LOC92539 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92539 BINDING SITE, designated SEQ ID:34499, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10281] Another function of VGAM132 is therefore inhibition of LOC92539 (Accession XM_045632). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92539. LOC92719 (Accession XM_046853) is another VGAM132 host target gene. LOC92719 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92719 BINDING SITE, designated SEQ ID:34848, to the nucleotide sequence of VGAM132 RNA, herein designated VGAM RNA, also designated SEQ ID:2843.

[10282] Another function of VGAM132 is therefore inhibition of LOC92719 (Accession XM_046853). Accordingly, utilities of VGAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92719. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 133 (VGAM133) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10283] VGAM133 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM133 was detected is described hereinabove with reference to Figs. 1–8.

[10284] VGAM133 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM133 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10285] VGAM133 gene encodes a VGAM133 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM133

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM133 precursor RNA is designated SEQ ID:119, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:119 is located at position 95821 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10286] VGAM133 precursor RNA folds onto itself, forming VGAM133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10287] An enzyme complex designated DICER COMPLEX, `dices` the VGAM133 folded precursor RNA into VGAM133 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM133 RNA is designated SEQ ID:2844, and is provided hereinbelow with reference to the sequence listing part.

[10288] VGAM133 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM133 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM133 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10289] VGAM133 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM133 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM133 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM133 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM133 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[10290] The complementary binding of VGAM133 RNA, herein designated VGAM RNA, to host target binding sites on VGAM133 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM133 host target RNA into VGAM133 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10291] It is appreciated that VGAM133 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM133 host target genes. The mRNA of

each one of this plurality of VGAM133 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM133 RNA, herein designated VGAM RNA, and which when bound by VGAM133 RNA causes inhibition of translation of respective one or more VGAM133 host target proteins.

[10292] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM133 gene, herein designated VGAM GENE, on one or more VGAM133 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[10293] It is yet further appreciated that a function of VGAM133 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM133 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM133 correlate with, and may be deduced from, the identity of the host target genes which VGAM133 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10294] Nucleotide sequences of the VGAM133 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM133 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM133 are further described hereinbelow with reference to Table 1.

[10295] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM133 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM133 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10296] As mentioned hereinabove with reference to Fig. 1, a function of VGAM133 gene, herein designated VGAM is inhibition of expression of VGAM133 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM133 correlate with, and may be deduced from, the identity of the target genes which VGAM133 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10297] Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423) is a VGAM133 host target gene. DVL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:10690, to the nucleotide sequence of VGAM133 RNA, herein designated VGAM RNA, also designated SEQ ID:2844.

[10298] A function of VGAM133 is therefore inhibition of Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession

NM_004423), a gene which regulates cell proliferation. Accordingly, utilities of VGAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3. The function of DVL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Natural Killer-tumor Recognition Sequence (NKTR, Accession NM_005385) is another VGAM133 host target gene. NKTR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NKTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NKTR BINDING SITE, designated SEQ ID:11862, to the nucleotide sequence of VGAM133 RNA, herein designated VGAM RNA, also designated SEQ ID:2844.

[10299] Another function of VGAM133 is therefore inhibition of Natural Killer-tumor Recognition Sequence (NKTR, Accession NM_005385), a gene which is involved in the function of nk cells. Accordingly, utilities of VGAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKTR. The function of NKTR

has been established by previous studies. The natural killer triggering receptor (NKTR) is involved in the recognition of tumor cells by large granular lymphocytes (LGLs) (Frey et al., 1991; Anderson et al., 1993). LGLs are a subpopulation of white blood cells that have the ability to kill target tumor cells by an MHC-independent mechanism. The protein product of the NKTR gene is present on the surface of LGLs and facilitates their binding to tumor targets. The gene codes for a protein of 150,000 Da, with a unique amino acid structure consisting of a 58-amino acid hydrophobic amino terminus followed by a cyclophilin-related domain. No other known mammalian receptor gene has been found to contain this strong identity to the cyclophilin protein in an external domain. By somatic cell hybrid analysis, Young et al. (1993) assigned the NKTR gene to 3p23-p21. Interspecific backcross analysis demonstrated that the murine homolog maps to the distal end of mouse chromosome 9 and is closely linked to the locus coding for cholecystokinin (Cck). This region of mouse 9 shares a region of homology with human 3p. Hybridization to DNA from a variety of species including the monkey, cat, and dog was observed, indicating that this gene is highly conserved among mammalian species.

Rinfret and Anderson (1993) observed 2 alternative splicing events in the 5-prime region of the NKTR mRNA in human and mouse. One uses an alternative exon 6 that disrupts the NKTR coding region and produces an mRNA encoding a truncated protein. The other splicing event generates a deletion by use of an alternative splice acceptor within exon 9. Rinfret and Anderson (1993) observed all 4 possible combinations of these events in cDNAs. Activation of natural killer cells by IL2 (OMIM Ref. No. 147680) changes the pattern of splicing, resulting in increased production of full-length protein. Simons-Evelyn et al. (1997) characterized the first 8 exons and 5-prime region of mouse Nktr. They found that mouse intron 5 also contains the alternative exon that disrupts the open reading frame.

[10300] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10301] Anderson, S. K.; Gallinger, S.; Roder, J.; Frey, J.; Young, H. A.; Ortaldo, J. R. : A cyclophilin-related protein involved in the function of natural killer cells. Proc. Nat. Acad. Sci. 90: 542-546, 1993. ; and

[10302] Rinfret, A.; Anderson, S. K. : IL-2 regulates the expression

of the NK-TR gene via an alternate RNA splicing mechanism. Molec. Immun. 30: 1307-1313, 1993.

[10303] Further studies establishing the function and utilities of NKTR are found in John Hopkins OMIM database record ID 161565, and in cited publications numbered 12732-12736 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Prostaglandin E Receptor 2 (subtype EP2), 53kDa (PTGER2, Accession NM_000956) is another VGAM133 host target gene. PTGER2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGER2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGER2 BINDING SITE, designated SEQ ID:6659, to the nucleotide sequence of VGAM133 RNA, herein designated VGAM RNA, also designated SEQ ID:2844.

[10304] Another function of VGAM133 is therefore inhibition of Prostaglandin E Receptor 2 (subtype EP2), 53kDa (PTGER2, Accession NM_000956), a gene which is a receptor for prostaglandin e2 mediating by g-s proteins that stimulates adenylate cyclase. Accordingly, utilities of VGAM133

include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGER2. The function of PTGER2 has been established by previous studies. Epithelial tumors may be regulated by cyclooxygenase (COX) enzyme products. To determine if COX2 (OMIM Ref. No. 600262) expression and PGE2 synthesis are upregulated in cervical cancers, Sales et al. (2001) used real-time quantitative PCR and Western blot analysis to confirm COX2 RNA and protein expression in squamous cell carcinomas and adenocarcinomas. In contrast, minimal expression of COX2 was detected in histologically normal cervix. Immunohistochemical analyses localized COX2 expression and PGE2 synthesis to neoplastic epithelial cells of all squamous cell carcinomas and adenocarcinomas studied. Immunoreactive COX2 and PGE2 were also colocalized to endothelial cells lining the microvasculature. To establish whether PGE2 has an autocrine/paracrine effect in cervical carcinomas, the authors investigated the expression of 2 subtypes of PGE2 receptors, namely EP2 and EP4 by real-time quantitative PCR. Expression of EP2 and EP4 receptors was significantly higher in carcinoma tissue than in histologically normal cervix. The authors concluded that COX2, EP2, and EP4 expression and PGE2 syn-

thesis are upregulated in cervical cancer tissue and that PGE₂ may regulate neoplastic cell function in cervical carcinoma in an autocrine/paracrine manner via the EP₂/EP₄ receptors. Animal model experiments lend further support to the function of PTGER₂. Using mice deficient in the prostaglandin EP₂ receptor, Tilley et al. (1999) showed that Ep₂ ^{-/-} females are infertile secondary to failure of the released ovum to become fertilized in vivo. Ep₂ ^{-/-} ova could be fertilized in vitro, suggesting that in addition to previously defined roles, prostaglandins may contribute to the microenvironment in which fertilization takes place. Besides its effects on reproduction, PGE₂ regulates regional blood flow in various vascular beds. Mice deficient in the EP₂ PGE₂ receptor displayed resting systolic blood pressure that was significantly lower than that in wildtype controls. Blood pressure increased in these animals when they were placed on a high salt diet, suggesting that the EP₂ receptor may be involved in sodium handling by the kidney.

[10305] It is appreciated that the abovementioned animal model for PTGER₂ is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

- [10306] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [10307] Tilley, S. L.; Audoly, L. P.; Hicks, E. H.; Kim, H.-S.; Flannery, P. J.; Coffman, T. M.; Koller, B. H. : Reproductive failure and reduced blood pressure in mice lacking the EP2 prostaglandin E-2 receptor. *J. Clin. Invest.* 103: 1539-1545, 1999. ; and
- [10308] Sales, K. J.; Katz, A. A.; Davis, M.; Hinz, S.; Soeters, R. P.; Hofmeyr, M. D.; Millar, R. P.; Jabbour, H. N. : Cyclooxygenase-2 expression and prostaglandin E2 synthesis are up-regulated.
- [10309] Further studies establishing the function and utilities of PTGER2 are found in John Hopkins OMIM database record ID 176804, and in cited publications numbered 1083 and 10841-10844 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Apoptosis Inhibitor 5 (API5, Accession NM_006595) is another VGAM133 host target gene. API5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by API5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of API5 BINDING SITE, designated SEQ ID:13361, to the nucleotide sequence of VGAM133 RNA, herein designated VGAM RNA, also designated SEQ ID:2844.

[10310] Another function of VGAM133 is therefore inhibition of Apoptosis Inhibitor 5 (API5, Accession NM_006595). Accordingly, utilities of VGAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with API5. FLJ12800 (Accession NM_022903) is another VGAM133 host target gene. FLJ12800 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12800 BINDING SITE, designated SEQ ID:23189, to the nucleotide sequence of VGAM133 RNA, herein designated VGAM RNA, also designated SEQ ID:2844.

[10311] Another function of VGAM133 is therefore inhibition of FLJ12800 (Accession NM_022903). Accordingly, utilities of VGAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12800. FLJ14600 (Accession NM_032810) is another VGAM133

host target gene. FLJ14600 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14600 BINDING SITE, designated SEQ ID:26574, to the nucleotide sequence of VGAM133 RNA, herein designated VGAM RNA, also designated SEQ ID:2844.

[10312] Another function of VGAM133 is therefore inhibition of FLJ14600 (Accession NM_032810). Accordingly, utilities of VGAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14600. HERV-H LTR-associating 2 (HHLA2, Accession NM_007072) is another VGAM133 host target gene. HHLA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HHLA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HHLA2 BINDING SITE, designated SEQ ID:13937, to the nucleotide sequence of VGAM133 RNA, herein designated VGAM RNA, also designated SEQ

ID:2844.

[10313] Another function of VGAM133 is therefore inhibition of HERV-H LTR-associating 2 (HHLA2, Accession NM_007072). Accordingly, utilities of VGAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HHLA2. LOC146227 (Accession XM_085374) is another VGAM133 host target gene. LOC146227 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146227 BINDING SITE, designated SEQ ID:38082, to the nucleotide sequence of VGAM133 RNA, herein designated VGAM RNA, also designated SEQ ID:2844.

[10314] Another function of VGAM133 is therefore inhibition of LOC146227 (Accession XM_085374). Accordingly, utilities of VGAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146227. LOC170063 (Accession XM_104820) is another VGAM133 host target gene. LOC170063 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC170063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170063 BINDING SITE, designated SEQ ID:42186, to the nucleotide sequence of VGAM133 RNA, herein designated VGAM RNA, also designated SEQ ID:2844.

[10315] Another function of VGAM133 is therefore inhibition of LOC170063 (Accession XM_104820). Accordingly, utilities of VGAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170063. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 134 (VGAM134) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10316] VGAM134 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM134 was detected is described hereinabove with reference to Figs. 1–8.

[10317] VGAM134 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM134 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10318] VGAM134 gene encodes a VGAM134 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM134 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM134 precursor RNA is designated SEQ ID:120, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:120 is located at position 80787 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10319] VGAM134 precursor RNA folds onto itself, forming VGAM134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[10320] An enzyme complex designated DICER COMPLEX, `dices` the VGAM134 folded precursor RNA into VGAM134 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM134 RNA is designated SEQ ID:2845, and is provided hereinbelow with reference to the sequence listing part.

[10321] VGAM134 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM134 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM134 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10322] VGAM134 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM134 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM134 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM134 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM134 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10323] The complementary binding of VGAM134 RNA, herein designated VGAM RNA, to host target binding sites on VGAM134 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM134 host target RNA into VGAM134 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10324] It is appreciated that VGAM134 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM134 host target genes. The mRNA of each one of this plurality of VGAM134 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM134 RNA, herein designated VGAM RNA, and which when bound by VGAM134 RNA causes inhibition of translation of respective one or more VGAM134 host target proteins.

[10325] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM134 gene, herein designated VGAM GENE, on one or more VGAM134 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10326] It is yet further appreciated that a function of VGAM134 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM134 correlate with, and may be deduced from, the identity of the host target genes which VGAM134 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10327] Nucleotide sequences of the VGAM134 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM134 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM134 are further described hereinbelow with reference to Table 1.

[10328] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM134 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM134 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10329] As mentioned hereinabove with reference to Fig. 1, a function of VGAM134 gene, herein designated VGAM is inhibition of expression of VGAM134 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM134 correlate with, and may be deduced from, the identity of the target genes which VGAM134 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10330] Interleukin 10 Receptor, Alpha (IL10RA, Accession XM_006447) is a VGAM134 host target gene. IL10RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL10RA, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL10RA BINDING SITE, designated SEQ ID:29998, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:2845.

[10331] A function of VGAM134 is therefore inhibition of Interleukin 10 Receptor, Alpha (IL10RA, Accession XM_006447), a gene which is a receptor for il-10. Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL10RA. The function of IL10RA has been established by previous studies. Interleukin-10 (OMIM Ref. No. 124092) is a cytokine produced by B cells, T helper cells, and cells of the monocyte/macrophage lineage that exhibits diverse activities on different cell lines. Tan et al. (1993) showed that the protein can be enzymatically iodinated to high specific radioactivity with retention of biologic activity. The radiolabeled ligand was found to bind specifically to its receptor in several mouse and human cell lines. For both mouse and human cell lines examined, there appeared to be at most only a few hundred IL10 receptors per cell. Mouse IL10 was capable of blocking binding of human IL10 to mouse but not human cells. Ho

et al. (1993) found that mouse il-10r is structurally related to interferon receptors. Since IL-10 inhibits macrophage activation by interferon-gamma, a possible implication of this relationship is interaction of IL-10R and IFN-gamma-R or their signaling pathways. Liu et al. (1994) assigned the IL10R gene to chromosome 11 by analysis of DNAs from human/hamster hybrid cell lines. Taniyama et al. (1995) regionalized the assignment to 11q23.3 by fluorescence in situ hybridization.

[10332] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10333] Ho, A. S. Y.; Liu, Y.; Khan, T. A.; Hsu, D.-H.; Bazan, J. F.; Moore, K. W. : A receptor for interleukin 10 is related to interferon receptors. Proc. Nat. Acad. Sci. 90: 11267-11271, 1993. ; and

[10334] Liu, Y.; Wei, S. H.-Y.; Ho, A. S.-Y.; de Waal Malefyt, R.; Moore, K. W. : Expression cloning and characterization of a human Il-10 receptor. J. Immun. 152: 1821-1829, 1994.

[10335] Further studies establishing the function and utilities of IL10RA are found in John Hopkins OMIM database record ID 146933, and in cited publications numbered

12525–12526, 88 and 2732 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. inositol(myo)–1(or 4)–monophosphatase 1 (IMPA1, Accession NM_005536) is another VGAM134 host target gene. IMPA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IMPA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPA1 BINDING SITE, designated SEQ ID:12056, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:2845.

[10336] Another function of VGAM134 is therefore inhibition of inositol(myo)–1(or 4)–monophosphatase 1 (IMPA1, Accession NM_005536), a gene which is responsible for the provision of inositol required for synthesis of phosphatidylinositol and polyphosphoinositides. Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPA1. The function of IMPA1 has been established by previous studies. Manic depressive illness (OMIM Ref. No. 125480) is a serious psychiatric disorder that in many,

but far from all, patients can be treated with lithium. The main causes for discontinuation of lithium therapy are unpleasant or serious side effects and lack of response. The reason for the striking variation in clinical efficacy of lithium treatment among bipolar patients is not known. The enzyme myo-inositol monophosphatase (OMIM Ref. No. IMPase) has been postulated as a target for the mood-stabilizing effects of lithium. The gene encoding human IMPase (IMPA1) was cloned by McAllister et al. (1992); variation in the 277-codon coding region of IMPA1 has not been observed in manic-depressive patients (Steen et al., 1996). It is nevertheless conceivable that polymorphisms or mutations in the noncoding regions of this gene could influence the lithium response in psychiatric patients. As a first step in investigating this possibility, Sjöholt et al. (1997) determined the genomic structure of the human IMPA1 gene. They found that it is composed of at least 9 exons and covers more than 20 kb of sequence on 8q21.13-q21.3. The chromosomal mapping was performed by PCR analysis of both CEPH megabase-insert YAC DNA pools and human/rodent somatic cell hybrid DNAs. In the 3-prime untranslated part of the gene, they observed a polymorphism (a G to A transition) and also 2

short sequences similar to the inositol/cholin-responsive element consensus. They postulated that 2 additional IMPA-like transcripts originate from the human genome, one from a position close to IMPA1 itself on chromosome 8 and the other from 18p

[10337] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10338] Sjholt, G.; Molven, A.; Lovlie, R.; Wilcox, A.; Sikela, J. M.; Steen, V. M. : Genomic structure and chromosomal localization of a human myo-inositol monophosphatase gene (IMPA). *Genomics* 45: 113–122, 1997. ; and

[10339] Steen, V. M.; Gulbrandsen, A. K.; Eiken, H. G.; Berle, J. O. : Lack of genetic variation in the coding region of the myo-inositol monophosphatase gene in lithium-treated patients with ma.

[10340] Further studies establishing the function and utilities of IMPA1 are found in John Hopkins OMIM database record ID 602064, and in cited publications numbered 8905–8907 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ribosomal Protein L17 (RPL17, Accession NM_000985) is another VGAM134 host target gene. RPL17

BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RPL17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPL17 BINDING SITE, designated SEQ ID:6696, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:2845.

[10341] Another function of VGAM134 is therefore inhibition of Ribosomal Protein L17 (RPL17, Accession NM_000985). Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL17. Src Family Associated Phosphoprotein 2 (SCAP2, Accession NM_003930) is another VGAM134 host target gene. SCAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAP2 BINDING SITE, designated SEQ ID:10028, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:2845.

[10342] Another function of VGAM134 is therefore inhibition of Src Family Associated Phosphoprotein 2 (SCAP2, Accession NM_003930), a gene which interacts with Src family protein tyrosine kinases and SLAP/FYB (SLA). Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAP2. The function of SCAP2 has been established by previous studies. Src family kinases (e.g., FYN; 137025) are involved in signal transduction of tyrosine and nontyrosine kinase receptors in a variety of cells. The Src kinase-associated phosphoprotein SKAP55 (OMIM Ref. No. 604969) is a constitutively tyrosine-phosphorylated, 55-kD protein that interacts with FYN and FYB (OMIM Ref. No. 602731) in T lymphocytes. Marie-Cardine et al. (1998) identified a cDNA encoding SKAP55R, which they called SKAP-HOM (SKAP55 homolog). Western blot and 2-dimensional isoelectric-focusing (IEF)/SDS-PAGE analysis showed that SKAP55R is more basic and migrates more slowly than SKAP55. In contrast to SKAP55, which is preferentially expressed in T cells, Northern blot analysis detected nearly ubiquitous expression of a 4.2-kb SKAP55R transcript as well as testis-specific 1.3- and 2.2-kb transcripts. Immunoblot analysis demonstrated that unlike

SKAP55, SKAP55R is not constitutively phosphorylated in T cells. The authors found that FYN but not LCK (OMIM Ref. No. 153390) or ZAP70 (OMIM Ref. No. 176947) phosphorylates both SKAP55 and SKAP55R.

[10343] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10344] Liu, J.; Kang, H.; Raab, M.; da Silva, A. J.; Kraeft, S.-K.; Rudd, C. E. : FYB (FYN binding protein) serves as a binding partner for lymphoid protein and FYN kinase substrate SKAP55 and a SKAP55-related protein in T cells. *Proc. Nat. Acad. Sci.* 95: 8779–8784, 1998. ; and

[10345] Marie-Cardine, A.; Verhagen, A. M.; Eckerskorn, C.; Schraven, B. : SKAP-HOM, a novel adaptor protein homologous to the FYN-associated protein SKAP55. *FEBS Lett.* 435: 55–60, 1998.

[10346] Further studies establishing the function and utilities of SCAP2 are found in John Hopkins OMIM database record ID 605215, and in cited publications numbered 6966–6968 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 15 Open Reading Frame 5 (C15orf5, Accession NM_030944) is another VGAM134 host target

gene. C15orf5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C15orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C15orf5 BINDING SITE, designated SEQ ID:25213, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:2845.

[10347] Another function of VGAM134 is therefore inhibition of Chromosome 15 Open Reading Frame 5 (C15orf5, Accession NM_030944). Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C15orf5. FLJ13105 (Accession NM_025001) is another VGAM134 host target gene. FLJ13105 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13105, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13105 BINDING SITE, designated SEQ ID:24571, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ

ID:2845.

[10348] Another function of VGAM134 is therefore inhibition of FLJ13105 (Accession NM_025001). Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13105. KIAA1198 (Accession XM_032674) is another VGAM134 host target gene. KIAA1198 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:31710, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:2845.

[10349] Another function of VGAM134 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. KIAA1795 (Accession XM_050988) is another VGAM134 host target gene. KIAA1795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1795, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1795 BINDING SITE, designated SEQ ID:35701, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:2845.

[10350] Another function of VGAM134 is therefore inhibition of KIAA1795 (Accession XM_050988). Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1795. KIAA1915 (Accession XM_055481) is another VGAM134 host target gene. KIAA1915 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1915 BINDING SITE, designated SEQ ID:36269, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:2845.

[10351] Another function of VGAM134 is therefore inhibition of KIAA1915 (Accession XM_055481). Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1915. LOC158798 (Accession XM_088671) is another VGAM134 host target gene. LOC158798 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158798 BINDING SITE, designated SEQ ID:39892, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:2845.

[10352] Another function of VGAM134 is therefore inhibition of LOC158798 (Accession XM_088671). Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158798. LOC221486 (Accession XM_165760) is another VGAM134 host target gene. LOC221486 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221486 BINDING SITE, designated SEQ ID:43744, to

the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:2845.

[10353] Another function of VGAM134 is therefore inhibition of LOC221486 (Accession XM_165760). Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221486. LOC51605 (Accession NM_015939) is another VGAM134 host target gene. LOC51605 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51605, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51605 BINDING SITE, designated SEQ ID:18061, to the nucleotide sequence of VGAM134 RNA, herein designated VGAM RNA, also designated SEQ ID:2845.

[10354] Another function of VGAM134 is therefore inhibition of LOC51605 (Accession NM_015939). Accordingly, utilities of VGAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51605. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 135 (VGAM135) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10355] VGAM135 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM135 was detected is described hereinabove with reference to Figs. 1–8.

[10356] VGAM135 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM135 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10357] VGAM135 gene encodes a VGAM135 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM135 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM135 precursor RNA is designated SEQ ID:121, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:121 is located at position 145555 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform

virus).

[10358] VGAM135 precursor RNA folds onto itself, forming VGAM135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10359] An enzyme complex designated DICER COMPLEX, `dices` the VGAM135 folded precursor RNA into VGAM135 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM135 RNA is designated SEQ ID:2846, and is provided hereinbelow with reference to the sequence listing part.

[10360] VGAM135 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM135 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM135 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10361] VGAM135 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM135 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM135 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM135 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM135 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10362] The complementary binding of VGAM135 RNA, herein designated VGAM RNA, to host target binding sites on VGAM135 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM135 host target RNA into VGAM135 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10363] It is appreciated that VGAM135 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM135 host target genes. The mRNA of each one of this plurality of VGAM135 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM135 RNA, herein designated VGAM RNA, and which when bound by VGAM135 RNA causes inhibition of translation of respective one or more VGAM135 host target proteins.

[10364] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM135 gene, herein designated VGAM GENE, on one or more VGAM135 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10365] It is yet further appreciated that a function of VGAM135 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific func-

tions, and accordingly utilities, of VGAM135 correlate with, and may be deduced from, the identity of the host target genes which VGAM135 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10366] Nucleotide sequences of the VGAM135 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM135 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM135 are further described hereinbelow with reference to Table 1.

[10367] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM135 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM135 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10368] As mentioned hereinabove with reference to Fig. 1, a function of VGAM135 gene, herein designated VGAM is inhibition of expression of VGAM135 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM135 correlate with, and may be deduced from, the identity of the target genes which VGAM135 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10369] Adenylate Kinase 3 (AK3, Accession NM_013410) is a VGAM135 host target gene. AK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AK3 BINDING SITE, designated SEQ ID:15073, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:2846.

[10370] A function of VGAM135 is therefore inhibition of Adenylate Kinase 3 (AK3, Accession NM_013410), a gene which Adenylate kinase 3; strongly similar to murine Ak4. Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK3. The function of AK3 has been established by previous studies. The adenylate kinases are a family of structurally and functionally related enzymes that catalyze a similar reaction, $\text{MgNTP} + \text{AMP} = \text{MgNDP} +$

ADP (N = A or G). The AK enzymes are important for maintenance of homeostasis of the adenine and guanine nucleotide pools. AK1 (OMIM Ref. No. 103000) is a cytosolic enzyme for which ATP is the substrate. AK2 (OMIM Ref. No. 103020) catalyzes the same reaction as AK1, but it is localized in the mitochondrial intermembrane space. AK3 is present in the mitochondrial matrix and prefers GTP over ATP as the substrate. Wilson et al. (1976) pointed out that AK3 is nucleosidetriphosphate-adenylate kinase. In the course of their efforts to identify the gene causing neurofibromatosis (NF1; 162200), Viskochil et al. (1990) found a gene first designated HB15, which Xu et al. (1992) subsequently concluded is probably a processed pseudogene of AK3. It is intronless and contains a polyadenylate tract, but retains coding potential because the open reading frame was not impaired by any observed base substitutions. One presumed processed pseudogene of AK3 is located within an intron of the NF1 gene. Xu et al. (1992) also characterized cDNA clones for the authentic AK3. By study of somatic cell hybrids, Povey et al. (1976) assigned AK3 to chromosome 9. The SRO (smallest region of overlap) for AK3 was estimated to be 9p24-p13 (Robson and Meera Khan, 1982). By interspecific back-

cross linkage analysis, Pilz et al. (1995) mapped the Ak3 gene to mouse chromosome 4. Gene map locus 9p24–p13

[10371] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10372] Xu, G.; O'Connell, P.; Stevens, J.; White, R. : Characterization of human adenylate kinase 3 (AK3) cDNA and mapping of the AK3 pseudogene to an intron of the NF1 gene. Genomics 13: 537–542, 1992. ; and

[10373] Pilz, A.; Woodward, K.; Povey, S.; Abbott, C. : Comparative mapping of 50 human chromosome 9 loci in the laboratory mouse. Genomics 25: 139–149, 1995.

[10374] Further studies establishing the function and utilities of AK3 are found in John Hopkins OMIM database record ID 103030, and in cited publications numbered 802–810 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ11210 (Accession XM_005298) is another VGAM135 host target gene. FLJ11210 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu–

cleotide sequences of FLJ11210 BINDING SITE, designated SEQ ID:29975, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:2846.

[10375] Another function of VGAM135 is therefore inhibition of FLJ11210 (Accession XM_005298). Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11210. KIAA1145 (Accession XM_037790) is another VGAM135 host target gene. KIAA1145 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1145 BINDING SITE, designated SEQ ID:32682, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:2846.

[10376] Another function of VGAM135 is therefore inhibition of KIAA1145 (Accession XM_037790). Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1145. MGC13105 (Accession XM_049394) is another

VGAM135 host target gene. MGC13105 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13105, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13105 BINDING SITE, designated SEQ ID:35408, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:2846.

[10377] Another function of VGAM135 is therefore inhibition of MGC13105 (Accession XM_049394). Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13105. LOC200014 (Accession XM_114087) is another VGAM135 host target gene. LOC200014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:42690, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:2846.

[10378] Another function of VGAM135 is therefore inhibition of LOC200014 (Accession XM_114087). Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014. LOC202934 (Accession XM_117486) is another VGAM135 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43467, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:2846.

[10379] Another function of VGAM135 is therefore inhibition of LOC202934 (Accession XM_117486). Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. LOC255465 (Accession XM_173206) is another VGAM135 host target gene. LOC255465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255465, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE, designated SEQ ID:46459, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:2846.

[10380] Another function of VGAM135 is therefore inhibition of LOC255465 (Accession XM_173206). Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255465. LOC257319 (Accession XM_171049) is another VGAM135 host target gene. LOC257319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257319 BINDING SITE, designated SEQ ID:45835, to the nucleotide sequence of VGAM135 RNA, herein designated VGAM RNA, also designated SEQ ID:2846.

[10381] Another function of VGAM135 is therefore inhibition of LOC257319 (Accession XM_171049). Accordingly, utilities of VGAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC257319. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 136 (VGAM136) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10382] VGAM136 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM136 was detected is described hereinabove with reference to Figs. 1–8.

[10383] VGAM136 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM136 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10384] VGAM136 gene encodes a VGAM136 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM136 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM136 precursor RNA is designated SEQ ID:122, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:122 is located at position 91976 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10385] VGAM136 precursor RNA folds onto itself, forming VGAM136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10386] An enzyme complex designated DICER COMPLEX, `dices` the VGAM136 folded precursor RNA into VGAM136 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM136 RNA is designated SEQ ID:2847, and is provided hereinbelow with reference to the sequence

listing part.

[10387] VGAM136 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM136 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM136 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10388] VGAM136 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM136 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM136 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM136 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM136 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10389] The complementary binding of VGAM136 RNA, herein designated VGAM RNA, to host target binding sites on VGAM136 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM136 host target RNA into VGAM136 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10390] It is appreciated that VGAM136 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM136 host target genes. The mRNA of each one of this plurality of VGAM136 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM136 RNA, herein designated VGAM

RNA, and which when bound by VGAM136 RNA causes inhibition of translation of respective one or more VGAM136 host target proteins.

[10391] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM136 gene, herein designated VGAM GENE, on one or more VGAM136 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10392] It is yet further appreciated that a function of VGAM136 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM136 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM136 correlate with, and may be deduced from, the identity of the host target genes which VGAM136 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10393] Nucleotide sequences of the VGAM136 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM136 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM136 are further described hereinbelow with reference to Table 1.

[10394] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM136 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM136 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10395] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM136 gene, herein designated VGAM is inhibition of expression of VGAM136 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM136 correlate with, and may be deduced from, the identity of the target genes which VGAM136 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10396] Jagged 2 (JAG2, Accession NM_002226) is a VGAM136 host target gene. JAG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAG2 BINDING SITE, designated SEQ ID:8006, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10397] A function of VGAM136 is therefore inhibition of Jagged 2 (JAG2, Accession NM_002226), a gene which is a putative notch ligand involved in the mediation of notch signaling. Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAG2. The function of JAG2 has been es-

established by previous studies. The Notch signaling pathway is a conserved intercellular signaling mechanism that is essential for proper embryonic development in numerous metazoan organisms. Members of the Notch gene family (see OMIM Ref. No. NOTCH1; 190198) encode transmembrane receptors that are critical for various cell fate decisions. Multiple ligands that activate Notch and related receptors have been identified, including Serrate and Delta in *Drosophila* and JAG1 (OMIM Ref. No. 601920) in vertebrates. By searching for human brain expressed sequence tags (ESTs) homologous to Serrate and Delta, Luo et al. (1997) identified a cDNA which they called Jagged-2 (JAG2). The predicted 1,238-amino acid JAG2 protein has several recognizable motifs, including a signal peptide, 16 EGF-like repeats, a transmembrane domain, and a short cytoplasmic domain. The amino acid sequence of human JAG2 is 89% identical to that of rat Jag2. Northern blot analysis and in situ hybridization showed expression of Jag2 in various murine tissues. Immunohistochemistry revealed coexpression of Jag2 and Notch1 within murine fetal thymus and other murine fetal tissues. Coculture of fibroblasts expressing human JAG2 with murine C2C12 myoblasts inhibited myogenic differentiation. This effect

was simulated by expression of constitutively active Notch1, suggesting that JAG2 engages the Notch1 pathway of signal transduction. Gray et al. (1999) also cloned JAG2, which they called HJ2. Northern blot analysis revealed expression of a 5.3-kb JAG2 transcript in heart and skeletal muscle, with weaker expression in pancreas. In situ hybridization analysis indicated upregulated expression of JAG2 in squamous cell carcinoma. Animal model experiments lend further support to the function of JAG2. Jiang et al. (1998) examined the in vivo role of the Jag2 gene by making a targeted mutation that removed a domain of the Jagged-2 protein required for receptor interaction. Mice homozygous for this deletion died perinatally because of defects in craniofacial morphogenesis. The mutant homozygotes exhibited cleft palate and fusion of the tongue with the palatal shelves. They also exhibited syndactyly of the fore- and hindlimbs. The apical ectodermal ridge (AER) of the limb buds of the mutant homozygotes was hyperplastic, and Jiang et al. (1998) observed an expanded domain of Fgf8 (OMIM Ref. No. 600483) expression in the AER. In the foot plates of the mutant homozygotes, both Bmp2 (OMIM Ref. No. 112261) and Bmp7 (OMIM Ref. No. 112267) expression and apoptotic inter-

digital cell death were reduced. Mutant homozygotes also displayed defects in thymic development, exhibiting altered thymic morphology and impaired differentiation of T cells of the gamma/delta lineage. These results demonstrated that Notch signaling mediated by Jag2 plays an essential role during limb, craniofacial, and thymic development in mice.

[10398] It is appreciated that the abovementioned animal model for JAG2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[10399] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10400] Lanford, P. J.; Lan, Y.; Jiang, R.; Lindsell, C.; Weinmaster, G.; Gridley, T.; Kelley, M. W. : Notch signalling pathway mediates hair cell development in mammalian cochlea. Nature Genet. 21: 289–292, 1999. ; and

[10401] Gray, G. E.; Mann, R. S.; Mitsiadis, E.; Henrique, D.; Carcangiu, M.–L.; Banks, A.; Leiman, J.; Ward, D.; Ish-Horowitz, D.; Artavanis–Tsakonas, S. : Human ligands of the Notch receptor.

[10402] Further studies establishing the function and utilities of

JAG2 are found in John Hopkins OMIM database record ID 602570, and in cited publications numbered 126 and 6218–6221 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Synaptobrevin-like 1 (SYBL1, Accession NM_005638) is another VGAM136 host target gene. SYBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYBL1 BINDING SITE, designated SEQ ID:12166, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10403] Another function of VGAM136 is therefore inhibition of Synaptobrevin-like 1 (SYBL1, Accession NM_005638), a gene which is synaptobrevin-like 1 and is similar to synaptobrevin. Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYBL1. The function of SYBL1 has been established by previous studies. From a search for expressed genes in the Xq28 pseudoautosomal region (PAR), D'Esposito et al. (1996) described a

2,576-bp cDNA encoding a synaptobrevin-like gene. The gene, tentatively named SYBL1 by them, encodes a 220-amino acid polypeptide of 25 kD with 60% similarity (37.5% homology) to an unpublished Arabidopsis gene sequence. SYBL1 was found, unlike all Xp pseudoautosomal genes studied to that time, to undergo X inactivation. In addition, it is also inactive on the Y chromosome, thereby maintaining dosage compensation in an unprecedented way. (The synaptobrevin genes, SYB1 (OMIM Ref. No. 185880) and SYB2 (OMIM Ref. No. 185881), are autosomal, being located on chromosomes 12 and 17, respectively.) In studies of the pseudoautosomal regions of the X and Y chromosomes, Ciccodicola et al. (2000) sequenced the telomeric 400 kb of the long arm of the human X chromosome, including 330 kb of the human Xq/Yq pseudoautosomal region and the telomere. Sequencing revealed subregions with distinctive regulatory and evolutionary features. The proximal 295 kb contains 2 genes inactivated on both the inactive X and Y chromosomes: SYBL1 and a human homolog of 'sprouty' in Drosophila. The GC-rich distal 35 kb, added in stages and much later in evolution, contains the X/Y expressed gene IL9R (OMIM Ref. No. 300007) and the gene CXYorf1 only 5 kb from

the Xq telomere. These properties make Xq/YqPAR a model for studies of region-specific gene inactivation, telomere evolution, and involvement in sex-limited conditions.

[10404] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10405] Ciccodicola, A.; D'Esposito, M.; Esposito, T.; Gianfrancesco, F.; Migliaccio, C.; Miano, M. G.; Matarazzo, M. Genet. 9: 395-401, 2000. ; and

[10406] D'Esposito, M.; Ciccodicola, A.; Gianfrancesco, F.; Esposito, T.; Flagiello, L.; Mazzearella, R.; Schlessinger, D.; D'Urso, M. : A synaptobrevin-like gene in the Xq28 pseudoautosomal re.

[10407] Further studies establishing the function and utilities of SYBL1 are found in John Hopkins OMIM database record ID 300053, and in cited publications numbered 9001-9004 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ10900 (Accession XM_037744) is another VGAM136 host target

gene. FLJ10900 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10900 BINDING SITE, designated SEQ ID:32669, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10408] Another function of VGAM136 is therefore inhibition of FLJ10900 (Accession XM_037744). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10900. FLJ20294 (Accession NM_017749) is another VGAM136 host target gene. FLJ20294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294 BINDING SITE, designated SEQ ID:19347, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10409] Another function of VGAM136 is therefore inhibition of FLJ20294 (Accession NM_017749). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20294. FLJ20297 (Accession NM_017951) is another VGAM136 host target gene. FLJ20297 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20297 BINDING SITE, designated SEQ ID:19647, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10410] Another function of VGAM136 is therefore inhibition of FLJ22690 (Accession NM_024711). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22690. FLJ22690 (Accession NM_024711) is another VGAM136 host target gene. FLJ22690 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22690, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22690 BINDING SITE, designated SEQ ID:24037, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10411] Another function of VGAM136 is therefore inhibition of FLJ22690 (Accession NM_024711). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22690. JM11 (Accession NM_033626) is another VGAM136 host target gene. JM11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JM11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JM11 BINDING SITE, designated SEQ ID:27327, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10412] Another function of VGAM136 is therefore inhibition of JM11 (Accession NM_033626). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JM11.

Potassium Voltage-gated Channel, Shab-related Subfamily, Member 2 (KCNB2, Accession XM_171186) is another VGAM136 host target gene. KCNB2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNB2 BINDING SITE, designated SEQ ID:45964, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10413] Another function of VGAM136 is therefore inhibition of Potassium Voltage-gated Channel, Shab-related Subfamily, Member 2 (KCNB2, Accession XM_171186). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNB2. KIAA0064 (Accession NM_014748) is another VGAM136 host target gene. KIAA0064 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0064, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0064 BINDING SITE, designated SEQ ID:16459, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10414] Another function of VGAM136 is therefore inhibition of KIAA0064 (Accession NM_014748). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0064. KIAA0202 (Accession XM_034872) is another VGAM136 host target gene. KIAA0202 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0202 BINDING SITE, designated SEQ ID:32179, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10415] Another function of VGAM136 is therefore inhibition of KIAA0202 (Accession XM_034872). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0202. KIAA0237 (Accession NM_014747) is another VGAM136 host target gene. KIAA0237 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16438, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10416] Another function of VGAM136 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0682 (Accession NM_014852) is another VGAM136 host target gene. KIAA0682 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0682 BINDING SITE, designated SEQ ID:16900, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10417] Another function of VGAM136 is therefore inhibition of

KIAA0682 (Accession NM_014852). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0682. KIAA1297 (Accession XM_051005) is another VGAM136 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35708, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10418] Another function of VGAM136 is therefore inhibition of KIAA1297 (Accession XM_051005). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. PB1 (Accession NM_018313) is another VGAM136 host target gene. PB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PB1 BINDING SITE, designated SEQ ID:20307, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10419] Another function of VGAM136 is therefore inhibition of PB1 (Accession NM_018313). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PB1. POLD3 (Accession XM_166243) is another VGAM136 host target gene. POLD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLD3 BINDING SITE, designated SEQ ID:44055, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10420] Another function of VGAM136 is therefore inhibition of POLD3 (Accession XM_166243). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLD3. ZER6 (Accession XM_032742) is another VGAM136 host

target gene. ZER6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZER6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZER6 BINDING SITE, designated SEQ ID:31742, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10421] Another function of VGAM136 is therefore inhibition of ZER6 (Accession XM_032742). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZER6. LOC146485 (Accession XM_007966) is another VGAM136 host target gene. LOC146485 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146485 BINDING SITE, designated SEQ ID:30071, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10422] Another function of VGAM136 is therefore inhibition of LOC146485 (Accession XM_007966). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146485. LOC153443 (Accession XM_087669) is another VGAM136 host target gene. LOC153443 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153443 BINDING SITE, designated SEQ ID:39372, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10423] Another function of VGAM136 is therefore inhibition of LOC153443 (Accession XM_087669). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153443. LOC153910 (Accession XM_087801) is another VGAM136 host target gene. LOC153910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153910, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153910 BINDING SITE, designated SEQ ID:39439, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10424] Another function of VGAM136 is therefore inhibition of LOC153910 (Accession XM_087801). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153910. LOC221421 (Accession XM_166428) is another VGAM136 host target gene. LOC221421 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221421 BINDING SITE, designated SEQ ID:44320, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10425] Another function of VGAM136 is therefore inhibition of LOC221421 (Accession XM_166428). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221421. LOC253805 (Accession XM_172854) is another VGAM136 host target gene. LOC253805 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253805 BINDING SITE, designated SEQ ID:46131, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10426] Another function of VGAM136 is therefore inhibition of LOC253805 (Accession XM_172854). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253805. LOC90190 (Accession XM_029758) is another VGAM136 host target gene. LOC90190 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90190 BINDING SITE, designated SEQ ID:30946, to the nucleotide sequence of VGAM136 RNA, herein designated

VGAM RNA, also designated SEQ ID:2847.

[10427] Another function of VGAM136 is therefore inhibition of LOC90190 (Accession XM_029758). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90190. LOC91115 (Accession XM_036218) is another VGAM136 host target gene. LOC91115 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91115 BINDING SITE, designated SEQ ID:32399, to the nucleotide sequence of VGAM136 RNA, herein designated VGAM RNA, also designated SEQ ID:2847.

[10428] Another function of VGAM136 is therefore inhibition of LOC91115 (Accession XM_036218). Accordingly, utilities of VGAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91115. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 137 (VGAM137) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10429] VGAM137 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM137 was detected is described hereinabove with reference to Figs. 1–8.

[10430] VGAM137 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM137 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10431] VGAM137 gene encodes a VGAM137 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM137 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM137 precursor RNA is designated SEQ ID:123, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:123 is located at position 74213 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10432] VGAM137 precursor RNA folds onto itself, forming VGAM137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10433] An enzyme complex designated DICER COMPLEX, `dices` the VGAM137 folded precursor RNA into VGAM137 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM137 RNA is designated SEQ ID:2848, and is provided hereinbelow with reference to the sequence listing part.

[10434] VGAM137 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM137 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM137 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10435] VGAM137 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM137 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM137 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM137 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM137 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10436] The complementary binding of VGAM137 RNA, herein designated VGAM RNA, to host target binding sites on VGAM137 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM137 host target RNA into VGAM137 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10437] It is appreciated that VGAM137 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM137 host target genes. The mRNA of each one of this plurality of VGAM137 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM137 RNA, herein designated VGAM RNA, and which when bound by VGAM137 RNA causes inhibition of translation of respective one or more VGAM137 host target proteins.

[10438] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM137 gene, herein designated VGAM GENE, on one or more VGAM137 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10439] It is yet further appreciated that a function of VGAM137 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM137 correlate

with, and may be deduced from, the identity of the host target genes which VGAM137 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10440] Nucleotide sequences of the VGAM137 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM137 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM137 are further described hereinbelow with reference to Table 1.

[10441] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM137 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM137 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10442] As mentioned hereinabove with reference to Fig. 1, a function of VGAM137 gene, herein designated VGAM is inhibition of expression of VGAM137 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM137 correlate with, and may be deduced

from, the identity of the target genes which VGAM137 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10443] Butyrophilin, Subfamily 2, Member A1 (BTN2A1, Accession NM_078476) is a VGAM137 host target gene. BTN2A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTN2A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN2A1 BINDING SITE, designated SEQ ID:27801, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:2848.

[10444] A function of VGAM137 is therefore inhibition of Butyrophilin, Subfamily 2, Member A1 (BTN2A1, Accession NM_078476). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN2A1. Cat Eye Syndrome Chromosome Region, Candidate 6 (CECR6, Accession NM_031890) is another VGAM137 host target gene. CECR6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CECR6,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR6 BINDING SITE, designated SEQ ID:25636, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:2848.

[10445] Another function of VGAM137 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 6 (CECR6, Accession NM_031890). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR6. Enabled Homolog (Drosophila) (ENAH, Accession NM_018212) is another VGAM137 host target gene. ENAH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENAH BINDING SITE, designated SEQ ID:20125, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:2848.

[10446] Another function of VGAM137 is therefore inhibition of

Enabled Homolog (Drosophila) (ENAH, Accession NM_018212). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENAH. FLJ11110 (Accession NM_018326) is another VGAM137 host target gene. FLJ11110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11110 BINDING SITE, designated SEQ ID:20320, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:2848.

[10447] Another function of VGAM137 is therefore inhibition of FLJ11110 (Accession NM_018326). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11110. KIAA0884 (Accession XM_046660) is another VGAM137 host target gene. KIAA0884 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0884 BINDING SITE, designated SEQ ID:34775, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:2848.

[10448] Another function of VGAM137 is therefore inhibition of KIAA0884 (Accession XM_046660). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0884. LOC163682 (Accession XM_099402) is another VGAM137 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42085, to the nucleotide sequence of VGAM137 RNA, herein designated VGAM RNA, also designated SEQ ID:2848.

[10449] Another function of VGAM137 is therefore inhibition of LOC163682 (Accession XM_099402). Accordingly, utilities of VGAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC163682. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 138 (VGAM138) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10450] VGAM138 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM138 was detected is described hereinabove with reference to Figs. 1–8.

[10451] VGAM138 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM138 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10452] VGAM138 gene encodes a VGAM138 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM138 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM138 precursor RNA is designated SEQ ID:124, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:124 is located at position 4877 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10453] VGAM138 precursor RNA folds onto itself, forming VGAM138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10454] An enzyme complex designated DICER COMPLEX, `dices` the VGAM138 folded precursor RNA into VGAM138 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM138 RNA is designated SEQ ID:2849, and is provided hereinbelow with reference to the sequence listing part.

[10455] VGAM138 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM138 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM138 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10456] VGAM138 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM138 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM138 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM138 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM138 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[10457] The complementary binding of VGAM138 RNA, herein designated VGAM RNA, to host target binding sites on VGAM138 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM138 host target RNA into VGAM138 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10458] It is appreciated that VGAM138 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM138 host target genes. The mRNA of each one of this plurality of VGAM138 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM138 RNA, herein designated VGAM RNA, and which when bound by VGAM138 RNA causes in-

hibition of translation of respective one or more VGAM138 host target proteins.

[10459] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM138 gene, herein designated VGAM GENE, on one or more VGAM138 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10460] It is yet further appreciated that a function of VGAM138 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM138 include diagnosis, prevention and

treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM138 correlate with, and may be deduced from, the identity of the host target genes which VGAM138 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10461] Nucleotide sequences of the VGAM138 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM138 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM138 are further described hereinbelow with reference to Table 1.

[10462] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM138 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM138 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10463] As mentioned hereinabove with reference to Fig. 1, a function of VGAM138 gene, herein designated VGAM is

inhibition of expression of VGAM138 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM138 correlate with, and may be deduced from, the identity of the target genes which VGAM138 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10464] Pallidin Homolog (mouse) (PLDN, Accession NM_012388) is a VGAM138 host target gene. PLDN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLDN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLDN BINDING SITE, designated SEQ ID:14744, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:2849.

[10465] A function of VGAM138 is therefore inhibition of Pallidin Homolog (mouse) (PLDN, Accession NM_012388), a gene which may play a role in intracellular vesicle trafficking. Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLDN. The function of PLDN has been established by previous studies. 'Pallid' is 1 of 13 platelet

storage pool deficiency (SPD) mouse mutants. Pallid (pa) animals suffer from prolonged bleeding time, pigment dilution, kidney lysosomal enzyme elevation, serum alpha-1-antitrypsin (OMIM Ref. No. 107400) activity deficiency, and abnormal otolith formation. As with other mouse mutants of this class, characterization of pallid mice suggested a defect in organelle biosynthesis. Huang et al. (1999) described the physical mapping, positional cloning, and mutational and functional analysis of the gene that is defective in pallid mice. The gene encodes a ubiquitously expressed, highly charged 172-amino acid protein, which they called pallidin, with no homology to known proteins. Huang et al. (1999) detected a nonsense mutation at codon 69 of this gene in the pallid mutant. Using a yeast 2-hybrid screen, Huang et al. (1999) discovered that pallidin interacts with syntaxin-13, a t-SNARE protein that mediates vesicle docking and fusion. Huang et al. (1999) confirmed this interaction by coimmunoprecipitation assay. Immunofluorescence studies corroborated that the cellular distribution of pallidin overlaps that of syntaxin-13. Whereas the 'mocha' (OMIM Ref. No. 607246) and 'pearl' (OMIM Ref. No. 603401) SPD mutants have defects in Ap3, the findings of Huang et al. (1999) suggested that

pallid SPD mutants are defective in a more downstream event of vesicle trafficking, namely vesicle docking and fusion. Huang et al. (1999) stated that 'pallid' was the fifth storage pool deficiency mutant to be described at the molecular level. These mutants are characterized by abnormalities in platelet-dense granules, melanosomes, and lysosomes, and in each case, the predicted protein is involved in organelle biogenesis. Huang et al. (1999) isolated the orthologous gene encoding human pallidin and found that the predicted protein has 86% amino acid identity with the mouse protein. The human pallidin cDNA sequence has been deposited in GenBank (AF080470). By coimmunoprecipitation and immunodepletion experiments of mouse skin fibroblasts, Falcon-Perez et al. (2002) identified pallidin as a component of BLOC1 (biogenesis of lysosome-related organelles complex-1), which also contains muted (OMIM Ref. No. 607289). A yeast 2-hybrid screen found no direct interaction between muted and pallidin, but pallidin was found to interact with itself. Residues that include 2 putative coiled-coil domains of human palladin were necessary and sufficient for self-assembly. Falcon-Perez et al. (2002) also determined that pallidin/BLOC1 could interact with actin filaments in vitro

and in transfected cells. Huang (2000) stated that ESTs of the human PA gene had been mapped to 15q15 by radiation hybrid mapping. By ancestral chromosome mapping, Huang et al. (1999) localized the mouse pallidin gene to chromosome 2E. The pallidin gene is closely linked to mouse Epb42 (OMIM Ref. No. 171070) and B2m (OMIM Ref. No. 109700), 68 cM from the centromere.

[10466] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10467] Falcon-Perez, J. M.; Starcevic, M.; Gautam, R.; Dell'Angelica, E. C. : BLOC-1, a novel complex containing the pallidin and muted proteins involved in the biogenesis of melanosomes and platelet-dense granules. J. Biol. Chem. 277: 28191-28199, 2002. ; and

[10468] Huang, L.; Kuo, Y.-M.; Gitschier, J. : The pallid gene encodes a novel, syntaxin 13-interacting protein involved in platelet storage pool deficiency. Nature Genet. 23: 329-332, 1999.

[10469] Further studies establishing the function and utilities of PLDN are found in John Hopkins OMIM database record ID 604310, and in cited publications numbered 7439-7441 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. MGC3101 (Accession NM_024043) is another VGAM138 host target gene. MGC3101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3101 BINDING SITE, designated SEQ ID:23477, to the nucleotide sequence of VGAM138 RNA, herein designated VGAM RNA, also designated SEQ ID:2849.

[10470] Another function of VGAM138 is therefore inhibition of MGC3101 (Accession NM_024043). Accordingly, utilities of VGAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3101. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 139 (VGAM139) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10471] VGAM139 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM139 was detected is described hereinabove with reference to Figs. 1–8.

[10472] VGAM139 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM139 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10473] VGAM139 gene encodes a VGAM139 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM139 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM139 precursor RNA is designated SEQ ID:125, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:125 is located at position 193809 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10474] VGAM139 precursor RNA folds onto itself, forming VGAM139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10475] An enzyme complex designated DICER COMPLEX, `dices` the VGAM139 folded precursor RNA into VGAM139 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM139 RNA is designated SEQ ID:2850, and is provided hereinbelow with reference to the sequence listing part.

[10476] VGAM139 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM139 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM139 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[10477] VGAM139 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM139 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM139 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM139 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM139 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10478] The complementary binding of VGAM139 RNA, herein designated VGAM RNA, to host target binding sites on VGAM139 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM139 host target RNA into VGAM139 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10479] It is appreciated that VGAM139 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM139 host target genes. The mRNA of each one of this plurality of VGAM139 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM139 RNA, herein designated VGAM RNA, and which when bound by VGAM139 RNA causes inhibition of translation of respective one or more VGAM139 host target proteins.

[10480] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM139 gene, herein designated VGAM GENE, on one or more VGAM139 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10481] It is yet further appreciated that a function of VGAM139 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM139 correlate with, and may be deduced from, the identity of the host target genes which VGAM139 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [10482] Nucleotide sequences of the VGAM139 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM139 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM139 are further described hereinbelow with reference to Table 1.
- [10483] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM139 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM139 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [10484] As mentioned hereinabove with reference to Fig. 1, a function of VGAM139 gene, herein designated VGAM is inhibition of expression of VGAM139 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM139 correlate with, and may be deduced from, the identity of the target genes which VGAM139 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [10485] Nuclear Receptor Subfamily 4, Group A, Member 2

(NR4A2, Accession NM_006186) is a VGAM139 host target gene. NR4A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR4A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR4A2 BINDING SITE, designated SEQ ID:12855, to the nucleotide sequence of VGAM139 RNA, herein designated VGAM RNA, also designated SEQ ID:2850.

[10486] A function of VGAM139 is therefore inhibition of Nuclear Receptor Subfamily 4, Group A, Member 2 (NR4A2, Accession NM_006186), a gene which may be a general coactivator of transcription. Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR4A2. The function of NR4A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM127. Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFB3, Accession NM_003243) is another VGAM139 host target gene. TGFB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by TGFBR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFBR3 BINDING SITE, designated SEQ ID:9248, to the nucleotide sequence of VGAM139 RNA, herein designated VGAM RNA, also designated SEQ ID:2850.

[10487] Another function of VGAM139 is therefore inhibition of Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFBR3, Accession NM_003243), a gene which involves in capturing and retaining TGF-beta for presentation to the signaling receptors. Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFBR3. The function of TGFBR3 has been established by previous studies. In addition to type I TGF-beta receptor (TGFBR1; 190181) and type II (TGFBR2; 190182), type III (OMIM Ref. No. TGFBR3) has been identified. It is a glycoprotein that binds TGF-beta and exists in both a membrane-bound and a soluble form. It may serve as a receptor accessory molecule in both the TGF-beta and fibroblast growth factor systems. TGFBR3 lacks a recognizable signaling domain and has no clearly defined role in TGF-beta signal-

ing. To investigate TGFBR3 function, Brown et al. (1999) studied cardiac endothelial cells in chick atrioventricular cushion explants. Endothelial cells undergoing epithelial-mesenchymal transformation expressed TGFBR3, and TGFBR3-specific antisera were found to inhibit mesenchyme formation and migration. Misexpression of TGFBR3 in nontransforming ventricular endothelial cells conferred transformation in response to TGF β 2. These results supported a model where TGFBR3 localizes transformation in the heart and plays an essential, nonredundant role in TGF β -signaling. Lewis et al. (2000) demonstrated that the type III TGF β -receptor, or beta-glycan, can function as an inhibin (see OMIM Ref. No. 147380) coreceptor with ActRII (OMIM Ref. No. 102581). Beta-glycan binds inhibin with high affinity and enhances binding in cells coexpressing ActRII and beta-glycan. Inhibin also forms crosslinked complexes with both recombinant and endogenously expressed beta-glycan and ActRII. Lewis et al. (2000) demonstrated that beta-glycan confers inhibin sensitivity to cell lines that otherwise respond poorly to this hormone. The ability of beta-glycan to inhibit to facilitate inhibin antagonism of activin (see OMIM Ref. No. 147290) provided a variation on the emerging

roles of proteoglycans as coreceptors modulating ligand-receptor sensitivity, selectivity, and function.

[10488] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10489] Brown, C. B.; Boyer, A. S.; Runyan, R. B.; Barnett, J. V. : Requirement of type III TGF-beta receptor for endocardial cell transformation in the heart. Science 283: 2080-2082, 1999. ; and

[10490] Lewis, K. A.; Gray, P. C.; Blount, A. L.; MacConell, L. A.; Wiater, E.; Bilezikjian, L. M.; Vale, W. : Betaglycan binds inhibin and can mediate functional antagonism of activin signalling.

[10491] Further studies establishing the function and utilities of TGFBR3 are found in John Hopkins OMIM database record ID 600742, and in cited publications numbered 757 and 7580 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ10560 (Accession NM_018138) is another VGAM139 host target gene. FLJ10560 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10560 BINDING SITE, designated SEQ ID:19936, to the nucleotide sequence of VGAM139 RNA, herein designated VGAM RNA, also designated SEQ ID:2850.

[10492] Another function of VGAM139 is therefore inhibition of FLJ10560 (Accession NM_018138). Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10560. FLJ20727 (Accession NM_017944) is another VGAM139 host target gene. FLJ20727 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20727 BINDING SITE, designated SEQ ID:19638, to the nucleotide sequence of VGAM139 RNA, herein designated VGAM RNA, also designated SEQ ID:2850.

[10493] Another function of VGAM139 is therefore inhibition of FLJ20727 (Accession NM_017944). Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20727.

KIAA1775 (Accession NM_033100) is another VGAM139 host target gene. KIAA1775 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1775 BINDING SITE, designated SEQ ID:26943, to the nucleotide sequence of VGAM139 RNA, herein designated VGAM RNA, also designated SEQ ID:2850.

[10494] Another function of VGAM139 is therefore inhibition of KIAA1775 (Accession NM_033100). Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1775. Synaptopodin 2 (SYNPO2, Accession XM_050219) is another VGAM139 host target gene. SYNPO2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNPO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNPO2 BINDING SITE, designated SEQ ID:35591, to the nucleotide sequence of VGAM139 RNA,

herein designated VGAM RNA, also designated SEQ ID:2850.

[10495] Another function of VGAM139 is therefore inhibition of Synaptopodin 2 (SYNPO2, Accession XM_050219). Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNPO2. TXI1 (Accession NM_018430) is another VGAM139 host target gene. TXI1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TXI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TXI1 BINDING SITE, designated SEQ ID:20492, to the nucleotide sequence of VGAM139 RNA, herein designated VGAM RNA, also designated SEQ ID:2850.

[10496] Another function of VGAM139 is therefore inhibition of TXI1 (Accession NM_018430). Accordingly, utilities of VGAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TXI1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger

140 (VGAM140) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10497] VGAM140 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM140 was detected is described hereinabove with reference to Figs. 1–8.

[10498] VGAM140 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM140 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10499] VGAM140 gene encodes a VGAM140 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM140 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM140 precursor RNA is designated SEQ ID:126, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:126 is located at position 51736 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10500] VGAM140 precursor RNA folds onto itself, forming VGAM140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10501] An enzyme complex designated DICER COMPLEX, `dices` the VGAM140 folded precursor RNA into VGAM140 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM140 RNA is designated SEQ ID:2851, and is provided hereinbelow with reference to the sequence listing part.

[10502] VGAM140 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM140 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM140 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10503] VGAM140 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM140 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM140 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM140 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM140 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10504] The complementary binding of VGAM140 RNA, herein designated VGAM RNA, to host target binding sites on VGAM140 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM140 host target RNA into VGAM140 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10505] It is appreciated that VGAM140 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM140 host target genes. The mRNA of each one of this plurality of VGAM140 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM140 RNA, herein designated VGAM RNA, and which when bound by VGAM140 RNA causes inhibition of translation of respective one or more VGAM140 host target proteins.

[10506] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM140 gene, herein designated VGAM GENE, on one or more VGAM140 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10507] It is yet further appreciated that a function of VGAM140 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM140 correlate

with, and may be deduced from, the identity of the host target genes which VGAM140 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10508] Nucleotide sequences of the VGAM140 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM140 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM140 are further described hereinbelow with reference to Table 1.

[10509] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM140 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM140 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10510] As mentioned hereinabove with reference to Fig. 1, a function of VGAM140 gene, herein designated VGAM is inhibition of expression of VGAM140 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM140 correlate with, and may be deduced

from, the identity of the target genes which VGAM140 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10511] Cullin 4B (CUL4B, Accession NM_003588) is a VGAM140 host target gene. CUL4B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CUL4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUL4B BINDING SITE, designated SEQ ID:9640, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10512] A function of VGAM140 is therefore inhibition of Cullin 4B (CUL4B, Accession NM_003588), a gene which is a negative regulator of the cell cycle in *C. elegans*. Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL4B. The function of CUL4B has been established by previous studies. Kipreos et al. (1996) identified the cullin gene family, which includes at least 5 members in nematodes, 6 in humans, and 3 in *S. cerevisiae*. See CUL1 (OMIM Ref. No. 603134). Human CUL4A (OMIM Ref. No.

603137) and CUL4B are orthologs of nematode cul4. The partial C-terminal amino acid sequences of CUL4A and CUL4B share 88% identity. Rasooly (1998) found that a brain cDNA isolated by Ishikawa et al. (1998), KIAA0695, was 99% identical to CUL4B. The predicted KIAA0695 protein is 717 amino acids long. Using RT-PCR, Ishikawa et al. (1998) determined that KIAA0695 is expressed ubiquitously. Although Ishikawa et al. (1998) mapped the KIAA0695 gene to human chromosome 10, Rasooly (1998) noted the presence of sequences in GenBank (AC002476) identical to CUL4B within a cloned region in Xq23.

[10513] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10514] Ishikawa, K.; Nagase, T.; Suyama, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. X. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 5: 169–176, 1998. ; and

[10515] Kipreos, E. T.; Lander, L. E.; Wing, J. P.; He, W. W.; Hedgecock, E. M. : cul-1 is required for cell cycle exit in C. ele-

gans and identifies a novel gene family. Cell 85: 829–839, 1996.

[10516] Further studies establishing the function and utilities of CUL4B are found in John Hopkins OMIM database record ID 300304, and in cited publications numbered 9440–9442 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Coagulation Factor II (thrombin) Receptor (F2R, Accession NM_001992) is another VGAM140 host target gene. F2R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2R BINDING SITE, designated SEQ ID:7720, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10517] Another function of VGAM140 is therefore inhibition of Coagulation Factor II (thrombin) Receptor (F2R, Accession NM_001992), a gene which Thrombin receptor; G protein-coupled receptor involved in platelet activation. Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with F2R. The function of F2R has been established by previous studies. Coughlin et al. (1992) reviewed the cloning and characterization of a platelet thrombin (OMIM Ref. No. 176930) receptor (Vu et al., 1991). The thrombin receptor is structurally related to other members of the 7-transmembrane receptor family and has been isolated from diverse cell types. It is intimately involved in the regulation of the thrombotic response. Using PCR analyses of a human/rodent hybrid cell mapping panel, Bahou et al. (1993) assigned the TR gene to chromosome 5. By fluorescence in situ hybridization, they refined the localization to 5q13, confirming its presence as a single locus in the human genome. Poirier et al. (1996) mapped the Cf2r gene to mouse chromosome 13 by studies of an interspecific backcross. Utilizing 2 distinct radiation hybrid mapping panels with different levels of resolution, Schmidt et al. (1997) demonstrated that this gene, sometimes referred to as PAR1, and the proteinase activated receptor-2 gene (OMIM Ref. No. 600933) are tightly linked. Physical mapping using yeast artificial chromosomes and inversion field gel electrophoresis demonstrated that they are maximally separated by 90 kb. Riewald et al. (2002) demonstrated that activated protein C (OMIM Ref. No. 176860)

uses the endothelial cell protein C receptor (EPCR; 600646) as a coreceptor for cleavage of protease-activated receptor 1 (PAR1) on endothelial cells. Gene profiling demonstrated that PAR1 signaling could account for all activated protein C-induced protective genes, including the immunomodulatory monocyte chemoattractant protein-1 (MCP1; 158105), which was selectively induced by activation of PAR1, but not PAR2 (OMIM Ref. No. 600933). Thus, Riewald et al. (2002) concluded that the prototypical thrombin receptor is the target for EPCR-dependent APC signaling, suggesting a role for this receptor cascade in protection from sepsis. Animal model experiments lend further support to the function of F2R. Griffin et al. (2001) reported a role for Par1, a protease-activated G protein-coupled receptor for thrombin, in embryonic development. Approximately one-half of Par1 $-/-$ embryos died at midgestation with bleeding from multiple sites. Par1 is expressed in endothelial cells, and a Par1 transgene driven by an endothelial-specific promoter prevented death of Par1 $-/-$ embryos. Griffin et al. (2001) concluded that the coagulation cascade and PAR1 modulate endothelial cell function in developing blood vessels and that thrombin's actions on endothelial cells, rather than

on platelets, mesenchymal cells, or fibrinogen (see OMIM Ref. No. 134820), contribute to vascular development and hemostasis in the mouse embryo.

[10518] It is appreciated that the abovementioned animal model for F2R is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[10519] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10520] Coughlin, S. R.; Vu, T.-K. H.; Hung, D. T.; Wheaton, V. I. : Characterization of a functional thrombin receptor: issues and opportunities. J. Clin. Invest. 89: 351-355, 1992. ; and

[10522] Further studies establishing the function and utilities of F2R are found in John Hopkins OMIM database record ID 187930, and in cited publications numbered 1750-175 and 5703-1756 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence. Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_030671) is another VGAM140 host target gene. PTPRO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPRO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRO BINDING SITE, designated SEQ ID:25028, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10523] Another function of VGAM140 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_030671), a gene which may function as a cell contact receptor that mediates and controls cell-cell signals. Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRO. The function of PTPRO has been established by previous studies. To identify protein-tyrosine phosphatases (PTPases) involved in the oncogenic process leading to the development of pancreatic carcinoma, Wang et al. (1996) performed PCR on pooled poly(A)+ RNA from 9 human pancreatic carcinoma cell

lines using PTPase consensus oligonucleotide primers. One of the novel PCR products recovered was termed PCP2 (pancreatic carcinoma phosphatase-2) and was used to screen a human pancreatic adenocarcinoma cDNA library. The full sequence of PCP2 predicts a 1,430 amino acid protein consisting of a putative extracellular domain of 740 amino acids, a single transmembrane domain, and an intracellular domain of 666 amino acids. The intracellular region contains 2 tandemly repeated PTP catalytic domains with a high degree of identity to the catalytic domains of mouse PTP-kappa and PTP-mu. In addition to a signal peptide and 13 potential N-linked glycosylation sites, the extracellular domain contains a MAM (meprin/A5/PTP-mu) domain followed by 1 Ig-like repeat and 4 putative fibronectin type III repeats. The MAM domain, found in *Xenopus* A5 glycoprotein, meprin A, and meprin B, as well as in PTP-kappa and PTP-mu, may be involved in attachment to the cytoskeleton. PCP2, PTP-kappa, and PTP-mu appear to form a subfamily of MAM-containing receptor-like PTPs (RPTPs). PCP2 also contains the tripeptide HAV, implicated in cell-cell contact in the cadherins. By Northern blot analysis, Wang et al. (1996) demonstrated that the 5.5-kb PCP2 transcript is widely

distributed at varying levels, with very high expression in brain, skeletal muscle, and pancreas, but no expression in placenta or spleen. Wang et al. (1996) demonstrated tyrosine phosphatase activity using an in vitro pNPP assay. Subcellular localization using laser scanning immunofluorescence microscopy showed localization of PCP2 at intercellular adhesions and colocalization with beta-catenin and E-cadherin. Wang et al. (1996) hypothesized that PCP2 and other members of this subfamily of RPTPases may function as cell contact receptors that mediate and control cell-cell signals. Wang et al. (1997) used degenerate PCR to clone PTP-J, a member of the type II receptor PTPase family. The PTP-J cDNA encodes a 1,436-amino acid polypeptide that includes a single transmembrane domain and a cytoplasmic domain containing 2 tandemly repeated PTP catalytic domains. The presence of 2 PTP domains indicates that this gene is a member of the type II receptor PTPases. Northern blot analysis detected expression in skeletal muscle, heart, prostate, pancreas, and placenta. Wang et al. (1997) found that in lymphocytes or lymphoma cells, expression of PTP-J is downregulated following stimulation by either phorbol myristate acetate (PMA) or calcium ionophore, suggesting that PMA or cal-

cium signaling pathways may be involved in regulating the expression of PTP-J.

[10524] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10525] Wang, B.; Kishihara, K.; Zhang, D.; Hara, H.; Nomoto, K. : Molecular cloning and characterization of a novel human receptor protein tyrosine phosphatase gene, hPTP-J: down-regulation of gene expression by PMA and calcium ionophore in Jurkat T lymphoma cells. *Biochem. Biophys. Res. Commun.* 231: 77-81, 1997. ; and

[10526] Wang, H; Lian, Z; Lerch, M. M.; Chen, Z; Xie, W; Ullrich, A. : Characterization of PCP-2, a novel receptor protein tyrosine phosphatase of the MAM domain family. *Oncogene* 12: 2555-2562.

[10527] Further studies establishing the function and utilities of PTPRO are found in John Hopkins OMIM database record ID 602454, and in cited publications numbered 6323-6324 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sirtuin Silent Mating Type Information Regulation 2 Homolog 3 (*S. cerevisiae*) (SIRT3, Accession NM_012239) is another VGAM140 host target gene. SIRT3 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by SIRT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRT3 BINDING SITE, designated SEQ ID:14545, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10528] Another function of VGAM140 is therefore inhibition of Sirtuin Silent Mating Type Information Regulation 2 Homolog 3 (*S. cerevisiae*) (SIRT3, Accession NM_012239), a gene which might function in telomeric silencing, cell cycle progression and chromosome stability. Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRT3. The function of SIRT3 has been established by previous studies. The yeast Sir2 protein (Shore et al., 1984) regulates epigenetic gene silencing and, as a possible antiaging effect, suppresses recombination of rDNA. Studies involving cobB, a bacterial Sir2-like gene, have suggested that Sir2 may encode a pyridine nucleotide transferase. By in silico and PCR-cloning techniques, Frye (1999) obtained cDNA sequences encoding 5 human

Sir2-like genes, which they called sirtuin-1 to -5 (SIRT1 to SIRT5). The SIRT1 (OMIM Ref. No. 604479) sequence has the closest homology to the *S. cerevisiae* Sir2 protein, while SIRT4 (OMIM Ref. No. 604482) and SIRT5 (OMIM Ref. No. 604483) more closely resemble prokaryotic sirtuin sequences. PCR analysis showed that the 5 human sirtuins are widely expressed in fetal and adult tissues. Recombinant human SIRT2 (OMIM Ref. No. 604480) was able to cause radioactivity to be transferred from (32P)NAD to bovine serum albumin (BSA). When a conserved histidine within SIRT2 was converted to tyrosine, the mutant recombinant protein was unable to transfer radioactivity from (32P)NAD to BSA. These results suggested that the sirtuins may function via mono-ADP-ribosylation of proteins. Tanny et al. (1999) showed that the yeast Sir2 protein can transfer labeled phosphate from nicotinamide adenine dinucleotide to itself and histones in vitro. A modified form of Sir2, which results from its automodification activity, was specifically recognized by anti-mono-ADP-ribose antibodies, suggesting that Sir2 is an ADP-ribosyltransferase. Mutation of a phylogenetically invariant histidine (his364 to tyr) in Sir2 abolished both its enzymatic activity in vitro and its silencing functions in

vivo. However, the mutant protein was associated with chromatin and other silencing factors in a manner similar to wildtype Sir2. These findings suggested that Sir2 contains an ADP-ribosyltransferase activity that is essential for its silencing function.

[10529] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10530] Tanny, J. C.; Dowd, G. J.; Huang, J.; Hilz, H.; Moazed, D. : An enzymatic activity in the yeast Sir2 protein that is essential for gene silencing. Cell 99: 735-745, 1999. ; and

[10531] Frye, R. A. : Characterization of five human cDNAs with homology to the yeast SIR2 gene: Sir2-like proteins (sirtuins) metabolize NAD and may have protein ADP-ribosyltransferase activity.

[10532] Further studies establishing the function and utilities of SIRT3 are found in John Hopkins OMIM database record ID 604481, and in cited publications numbered 5008, 504 and 5051 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 16 (monocarboxylic acid transporters), Member 1 (SLC16A1, Accession NM_003051) is another VGAM140 host target gene. SLC16A1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC16A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC16A1 BINDING SITE, designated SEQ ID:9014, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10533] Another function of VGAM140 is therefore inhibition of Solute Carrier Family 16 (monocarboxylic acid transporters), Member 1 (SLC16A1, Accession NM_003051), a gene which is a Proton-monocarboxylate cotransporter that transports lactate and pyruvate. Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A1. The function of SLC16A1 has been established by previous studies. The monocarboxylate transporter (MCT) mediates the movement of lactate and pyruvate across cell membranes (Garcia et al., 1994). Import and export of these substrates by tissues such as erythrocytes, muscle, intestine, and kidney are ascribed largely to the action of a proton-coupled MCT. Kim et al. (1992) cloned a cDNA for MCT1, which encodes a protein with 12 puta-

tive membrane-spanning regions; it was originally isolated by an expression cloning strategy designed to identify the mevalonate transporter in a mutant Chinese hamster ovary (CHO) cell line. The cloned mevalonate transporter turned out to be a mutant protein, designated Mev, that differed from its wildtype progenitor by 1 amino acid in the tenth membrane spanning region, which changed a phenylalanine (wildtype) to a cysteine (OMIM Ref. No. mutant). The finding that the wildtype cDNA did not elicit increased mevalonate transport in transfected cells suggested that the wildtype protein is a transporter for a molecule other than mevalonate. Indeed, subsequent studies by Garcia et al. (1994) showed that lactate, pyruvate, and related monocarboxylates can be transported by the wildtype molecule, designated MCT1 by them. This protein exhibits properties that resemble those of the erythrocyte MCT, including proton symport, trans acceleration, and sensitivity to alpha-cyanocinnamates. The amino acid sequence of MCT1 did not resemble that of any known protein, suggesting that MCT1 may represent a new class of solute carriers (solute carrier family 16). Garcia et al. (1994) used the hamster cDNA to isolate genomic cDNA clones for human MCT1. Comparison of the

human and hamster amino acid sequences demonstrated that the proteins are 86% identical. The gene for human MCT1, symbolized SLC16A1, was localized to 1p13.2–p12 by PCR analysis of panels of human/rodent cell hybrid lines and by fluorescence chromosomal in situ hybridization.

- [10537] Further studies establishing the function and utilities of SLC16A1 are found in John Hopkins OMIM database record ID 600682, and in cited publications numbered 7130–7132 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Activator

of Basal Transcription 1 (ABT1, Accession NM_013375) is another VGAM140 host target gene. ABT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABT1 BINDING SITE, designated SEQ ID:15029, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10538] Another function of VGAM140 is therefore inhibition of Activator of Basal Transcription 1 (ABT1, Accession NM_013375). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABT1. CNIL (Accession NM_005776) is another VGAM140 host target gene. CNIL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNIL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNIL BINDING SITE, designated SEQ ID:12353, to the nucleotide sequence of VGAM140 RNA, herein designated

VGAM RNA, also designated SEQ ID:2851.

[10539] Another function of VGAM140 is therefore inhibition of CNIL (Accession NM_005776). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNIL. FLJ10876 (Accession NM_018254) is another VGAM140 host target gene. FLJ10876 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10876 BINDING SITE, designated SEQ ID:20220, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10540] Another function of VGAM140 is therefore inhibition of FLJ10876 (Accession NM_018254). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10876. FLJ14957 (Accession NM_032866) is another VGAM140 host target gene. FLJ14957 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14957, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14957 BINDING SITE, designated SEQ ID:26679, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10541] Another function of VGAM140 is therefore inhibition of FLJ14957 (Accession NM_032866). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14957. FLJ20174 (Accession NM_017699) is another VGAM140 host target gene. FLJ20174 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20174 BINDING SITE, designated SEQ ID:19267, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10542] Another function of VGAM140 is therefore inhibition of FLJ20174 (Accession NM_017699). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ20174. FLJ20847 (Accession XM_170677) is another VGAM140 host target gene. FLJ20847 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20847, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20847 BINDING SITE, designated SEQ ID:45457, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10543] Another function of VGAM140 is therefore inhibition of FLJ20847 (Accession XM_170677). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20847. Glucosidase, Beta (bile acid) 2 (GBA2, Accession XM_048518) is another VGAM140 host target gene. GBA2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GBA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBA2 BINDING SITE, designated SEQ ID:35178, to the nu-

cleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10544] Another function of VGAM140 is therefore inhibition of Glucosidase, Beta (bile acid) 2 (GBA2, Accession XM_048518). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBA2. KIAA0923 (Accession NM_014021) is another VGAM140 host target gene. KIAA0923 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0923 BINDING SITE, designated SEQ ID:15241, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10545] Another function of VGAM140 is therefore inhibition of KIAA0923 (Accession NM_014021). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0923. KIAA0937 (Accession XM_166213) is another VGAM140 host target gene. KIAA0937 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0937 BINDING SITE, designated SEQ ID:44013, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10546] Another function of VGAM140 is therefore inhibition of KIAA0937 (Accession XM_166213). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0937. KIAA1203 (Accession XM_049683) is another VGAM140 host target gene. KIAA1203 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1203 BINDING SITE, designated SEQ ID:35468, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10547] Another function of VGAM140 is therefore inhibition of

KIAA1203 (Accession XM_049683). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1203. KIAA1796 (Accession XM_166146) is another VGAM140 host target gene. KIAA1796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1796 BINDING SITE, designated SEQ ID:43964, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10548] Another function of VGAM140 is therefore inhibition of KIAA1796 (Accession XM_166146). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1796. Transducer of ERBB2, 2 (TOB2, Accession XM_170995) is another VGAM140 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45765, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10549] Another function of VGAM140 is therefore inhibition of Transducer of ERBB2, 2 (TOB2, Accession XM_170995). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOB2. TP53TG3 (Accession NM_015369) is another VGAM140 host target gene. TP53TG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TP53TG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53TG3 BINDING SITE, designated SEQ ID:17669, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10550] Another function of VGAM140 is therefore inhibition of TP53TG3 (Accession NM_015369). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53TG3. LOC147671 (Accession XM_085844) is another VGAM140

host target gene. LOC147671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147671 BINDING SITE, designated SEQ ID:38377, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10551] Another function of VGAM140 is therefore inhibition of LOC147671 (Accession XM_085844). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147671. LOC253805 (Accession XM_172854) is another VGAM140 host target gene. LOC253805 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253805 BINDING SITE, designated SEQ ID:46134, to the nucleotide sequence of VGAM140 RNA, herein designated VGAM RNA, also designated SEQ ID:2851.

[10552] Another function of VGAM140 is therefore inhibition of LOC253805 (Accession XM_172854). Accordingly, utilities of VGAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253805. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 141 (VGAM141) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10553] VGAM141 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM141 was detected is described hereinabove with reference to Figs. 1–8.

[10554] VGAM141 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM141 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10555] VGAM141 gene encodes a VGAM141 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM141

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM141 precursor RNA is designated SEQ ID:127, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:127 is located at position 151833 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10556] VGAM141 precursor RNA folds onto itself, forming VGAM141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10557] An enzyme complex designated DICER COMPLEX, `dices` the VGAM141 folded precursor RNA into VGAM141 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM141 RNA is designated SEQ ID:2852, and is provided hereinbelow with reference to the sequence listing part.

[10558] VGAM141 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM141 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM141 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10559] VGAM141 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM141 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM141 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM141 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM141 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[10560] The complementary binding of VGAM141 RNA, herein designated VGAM RNA, to host target binding sites on VGAM141 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM141 host target RNA into VGAM141 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10561] It is appreciated that VGAM141 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM141 host target genes. The mRNA of

each one of this plurality of VGAM141 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM141 RNA, herein designated VGAM RNA, and which when bound by VGAM141 RNA causes inhibition of translation of respective one or more VGAM141 host target proteins.

[10562] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM141 gene, herein designated VGAM GENE, on one or more VGAM141 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[10563] It is yet further appreciated that a function of VGAM141 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM141 correlate with, and may be deduced from, the identity of the host target genes which VGAM141 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10564] Nucleotide sequences of the VGAM141 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM141 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM141 are further described hereinbelow with reference to Table 1.

[10565] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM141 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM141 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10566] As mentioned hereinabove with reference to Fig. 1, a function of VGAM141 gene, herein designated VGAM is inhibition of expression of VGAM141 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM141 correlate with, and may be deduced from, the identity of the target genes which VGAM141 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10567] Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM_006283) is a VGAM141 host target gene. TACC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TACC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACC1 BINDING SITE, designated SEQ ID:12966, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:2852.

[10568] A function of VGAM141 is therefore inhibition of Trans-

forming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM_006283). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACC1. Trans-membrane, Prostate Androgen Induced RNA (TMEPAI, Accession NM_020182) is another VGAM141 host target gene. TMEPAI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMEPAI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMEPAI BINDING SITE, designated SEQ ID:21402, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:2852.

[10569] Another function of VGAM141 is therefore inhibition of Transmembrane, Prostate Androgen Induced RNA (TMEPAI, Accession NM_020182). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEPAI. FLJ00026 (Accession XM_036307) is another VGAM141 host target gene. FLJ00026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ00026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00026 BINDING SITE, designated SEQ ID:32424, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:2852.

[10570] Another function of VGAM141 is therefore inhibition of FLJ00026 (Accession XM_036307). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00026. FLJ11320 (Accession NM_018389) is another VGAM141 host target gene. FLJ11320 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11320 BINDING SITE, designated SEQ ID:20428, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:2852.

[10571] Another function of VGAM141 is therefore inhibition of FLJ11320 (Accession NM_018389). Accordingly, utilities of

VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11320. FLJ14917 (Accession NM_032861) is another VGAM141 host target gene. FLJ14917 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14917 BINDING SITE, designated SEQ ID:26665, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:2852.

[10572] Another function of VGAM141 is therefore inhibition of FLJ14917 (Accession NM_032861). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14917. FLJ22794 (Accession XM_166220) is another VGAM141 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE,

designated SEQ ID:44024, to the nucleotide sequence of VGAM141 RNA, herein designated VGAM RNA, also designated SEQ ID:2852.

[10573] Another function of VGAM141 is therefore inhibition of FLJ22794 (Accession XM_166220). Accordingly, utilities of VGAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 142 (VGAM142) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10574] VGAM142 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM142 was detected is described hereinabove with reference to Figs. 1–8.

[10575] VGAM142 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM142 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10576] VGAM142 gene encodes a VGAM142 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM142 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM142 precursor RNA is designated SEQ ID:128, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:128 is located at position 150841 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10577] VGAM142 precursor RNA folds onto itself, forming VGAM142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10578] An enzyme complex designated DICER COMPLEX, `dices` the VGAM142 folded precursor RNA into VGAM142 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM142 RNA is designated SEQ ID:2853, and is provided hereinbelow with reference to the sequence listing part.

[10579] VGAM142 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM142 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM142 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10580] VGAM142 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM142 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM142 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM142 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM142 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10581] The complementary binding of VGAM142 RNA, herein designated VGAM RNA, to host target binding sites on VGAM142 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM142 host target RNA into VGAM142 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10582] It is appreciated that VGAM142 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM142 host target genes. The mRNA of each one of this plurality of VGAM142 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM142 RNA, herein designated VGAM RNA, and which when bound by VGAM142 RNA causes inhibition of translation of respective one or more VGAM142 host target proteins.

[10583] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM142 gene, herein designated VGAM GENE, on one or more VGAM142 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[10584] It is yet further appreciated that a function of VGAM142 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM142 correlate with, and may be deduced from, the identity of the host target genes which VGAM142 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10585] Nucleotide sequences of the VGAM142 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM142 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM142 are further described hereinbelow with reference to Table 1.

[10586] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM142 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM142 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10587] As mentioned hereinabove with reference to Fig. 1, a function of VGAM142 gene, herein designated VGAM is inhibition of expression of VGAM142 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM142 correlate with, and may be deduced from, the identity of the target genes which VGAM142 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10588] D10S170 (Accession NM_005436) is a VGAM142 host target gene. D10S170 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by D10S170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D10S170 BINDING SITE, designated SEQ ID:11919, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10589] A function of VGAM142 is therefore inhibition of D10S170 (Accession NM_005436), a gene which may provide a structural basis for generation of RET/PTC1 rearrangement. Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D10S170. The function of D10S170 has been established by previous studies. The PTC1 chimeric oncogene (RET/PTC1), which is detected only in papillary thyroid carcinoma (OMIM Ref. No. 188550), is generated by the fusion of the tyrosine kinase domain of the RET protooncogene (OMIM Ref. No. 164761) to the 5-prime terminal region of another gene, H4 (Donghi et al., 1989; Grieco et al., 1990; Sozzi et al., 1991). PTC1 oncogene occurs in as many as 30% of papillary thyroid carcinomas. The fusion gene is formed through intrachromosomal 'illegitimate' recombination involving an inversion of 10q (Pierotti et al., 1992). The H4 gene shows no significant homology to known genes, and the function of H4 protein is unknown. The RET protooncogene encodes a receptor-type tyrosine kinase, whose receptor is glial cell line-derived neurotrophic factor (OMIM Ref. No. 600837). Tong et al., (1995) showed that the putative leucine zipper in the N-terminal region

of H4 can mediate oligomerization of the PTC1 oncogene in vitro. Tong et al. (1997) demonstrated that the PTC1 oncogene forms a dimer in vivo, and the leucine zipper is responsible for this dimerization. Constitutive dimerization of the PTC1 oncogene appears to be essential for PTC1 transforming activity and constitutive oligomerization acquired by rearrangement or by point mutations may be a general mechanism for the activation of receptor tyrosine kinase oncogenes. See 601984 for discussion of the PTC3 chimeric oncogene. Nikiforova et al. (2000) asked whether, despite the great linear distance (30 mg) between RET and H4, recombination might be promoted by their proximity in the nucleus. Nikiforova et al. (2000) used 2-color FISH and 3-dimensional microscopy to map the positions of the RET and H4 loci within interphase nuclei. At least one pair of RET and H4 was juxtaposed in 35% of normal human thyroid cells and in 21% of peripheral blood lymphocytes, but only in 6% of normal mammary epithelial cells. Nikiforova et al. (2000) suggested that spatial contiguity of RET and H4 may provide a structural basis for generation of RET/PTC1 rearrangement by allowing a single radiation track to produce a double-strand break in each gene at the same site in the nucleus.

[10590] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

D.; Della Porta, G.; Vecchio, G. : Characterization of an inversion on the long arm of chromosome 10 juxtaposing D10S170 and RET and creating the oncogenic sequence RET/PTC. Proc. Nat. Acad. Sci. 89: 1616–1620, 1992. ; and

[10592] Nikiforova, M. N.; Stringer, J. R.; Blough, R.; Medvedovic, M.; Fagin, J. A.; Nikiforov, Y. E. : Proximity of chromosomal loci that participate in radiation-induced rearrangements in hu.

[10593] Further studies establishing the function and utilities of D10S170 are found in John Hopkins OMIM database record ID 601985, and in cited publications numbered 8897, 3532, 8898, 8899–890 and 1145 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hepatic Leukemia Factor (HLF, Accession NM_002126) is another VGAM142 host target gene. HLF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

HLF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLF BINDING SITE, designated SEQ ID:7905, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10594] Another function of VGAM142 is therefore inhibition of Hepatic Leukemia Factor (HLF, Accession NM_002126). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLF. Interleukin 12B (natural killer cell stimulatory factor 2, cytotoxic lymphocyte maturation factor 2, p40) (IL12B, Accession NM_002187) is another VGAM142 host target gene. IL12B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL12B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL12B BINDING SITE, designated SEQ ID:7944, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10595] Another function of VGAM142 is therefore inhibition of

Interleukin 12B (natural killer cell stimulatory factor 2, cytotoxic lymphocyte maturation factor 2, p40) (IL12B, Accession NM_002187). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL12B. Interleukin 1 Receptor Accessory Protein (IL1RAP, Accession NM_002182) is another VGAM142 host target gene. IL1RAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1RAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RAP BINDING SITE, designated SEQ ID:7941, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10596] Another function of VGAM142 is therefore inhibition of Interleukin 1 Receptor Accessory Protein (IL1RAP, Accession NM_002182), a gene which may function as a membrane receptor. promotes heterophilic cellular adhesion. Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RAP. The function of IL1RAP has been

established by previous studies. Interleukin-1 (IL1; 147760, 147720) receptor accessory protein (OMIM Ref. No. IL1RAP) is a transmembrane protein that is required for IL1 signal transduction (Wesche et al., 1997). Huang et al. (1997) isolated a human IL1RAP cDNA, called IL1RAcP by them, by screening a placenta cDNA library with a mouse Il1rap cDNA. They found that treatment of cells with IL1 induced the formation of a complex containing IL1RAP and type I IL1 receptor (IL1RA; 147810). The serine/threonine kinase IRAK (OMIM Ref. No. 300283) was recruited to this complex through its association with IL1RAP. Overexpression of mutant IL1RAP proteins lacking the intracellular IRAK-binding domain prevented the recruitment of IRAK to the receptor complex. By fluorescence in situ hybridization and radiation hybrid analysis, Dale et al. (1998) mapped the IL1RAP gene to 3q28.

[10597] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10598] Huang, J.; Gao, X.; Li, S.; Cao, Z. : Recruitment of IRAK to the interleukin 1 receptor complex requires interleukin 1 receptor accessory protein. Proc. Nat. Acad. Sci. 94: 12829-12832, 1997. ; and

[10599] Wesche, H.; Korherr, C.; Kracht, M.; Falk, W.; Resch, K.; Martin, M. U. : The interleukin-1 receptor accessory protein (IL-1RAcP) is essential for IL-1-induced activation of interleukin.

[10600] Further studies establishing the function and utilities of IL1RAP are found in John Hopkins OMIM database record ID 602626, and in cited publications numbered 8562-8564 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sodium Channel, Nonvoltage-gated 1, Gamma (SCNN1G, Accession NM_001039) is another VGAM142 host target gene. SCNN1G BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCNN1G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCNN1G BINDING SITE, designated SEQ ID:6706, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10601] Another function of VGAM142 is therefore inhibition of Sodium Channel, Nonvoltage-gated 1, Gamma (SCNN1G, Accession NM_001039). Accordingly, utilities of VGAM142

include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCNN1G. Solute Carrier Family 24 (sodium/potassium/calcium exchanger), Member 1 (SLC24A1, Accession NM_004727) is another VGAM142 host target gene. SLC24A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC24A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC24A1 BINDING SITE, designated SEQ ID:11103, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10602] Another function of VGAM142 is therefore inhibition of Solute Carrier Family 24 (sodium/potassium/calcium exchanger), Member 1 (SLC24A1, Accession NM_004727), a gene which is a critical component of the visual transduction cascade, controlling the calcium concentration of outer segments during light and darkness. Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC24A1. The function of SLC24A1 has been established by previous studies. By screening a human retinal

cDNA library using the entire bovine rod sodium/potassium/calcium (Na-Ca+K) exchanger cDNA as a probe, Tucker et al. (1998) cloned the human NCKX1 gene. Human NCKX1 codes for a protein of 1,081 amino acids that shows 64% overall identity with the bovine protein. The 2 sets of putative transmembrane domains and their short connecting loops showed 94% identity, while the extracellular loop at the amino terminus was only 59% identical. Tucker et al. (1998) determined the genomic structure of the NCKX1 gene and found 1 intron in the 5-prime untranslated region and 8 within the coding region. Exon length varies from 54 to 2,037 bp Using fluorescence in situ hybridization and analysis of a radiation hybrid panel, Tucker et al. (1998) mapped the NCKX1 gene to chromosome 15q22

[10603] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10604] Tucker, J. E.; Winkfein, R. J.; Cooper, C. B.; Schnetkamp, P. P. : cDNA cloning of the human retinal rod Na-Ca + K exchanger: comparison with a revised bovine sequence. Invest. Ophthal. Vis. Sci. 39: 435-440, 1998. ; and

Walter, M. A.; Demetrick, D. J.; Schnetkamp, P. P. M. :
Chromosomal localization and genomic organization of
the human retina.

[10606] Further studies establishing the function and utilities of
SLC24A1 are found in John Hopkins OMIM database
record ID 603617, and in cited publications numbered
7591–7592 listed in the bibliography section hereinbelow,
which are also hereby incorporated by reference. SWI/SNF
Related, Matrix Associated, Actin Dependent Regulator of
Chromatin, Subfamily C, Member 1 (SMARCC1, Accession
NM_003074) is another VGAM142 host target gene.
SMARCC1 BINDING SITE is HOST TARGET binding site
found in the 3' untranslated region of mRNA encoded by
SMARCC1, corresponding to a HOST TARGET binding site
such as BINDING SITE I, BINDING SITE II or BINDING SITE III.
Table 2 illustrates the complementarity of the nucleotide
sequences of SMARCC1 BINDING SITE, designated SEQ
ID:9040, to the nucleotide sequence of VGAM142 RNA,
herein designated VGAM RNA, also designated SEQ
ID:2853.

[10607] Another function of VGAM142 is therefore inhibition of
SWI/SNF Related, Matrix Associated, Actin Dependent
Regulator of Chromatin, Subfamily C, Member 1

(SMARCC1, Accession NM_003074), a gene which is involved in chromatin remodeling. Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCC1. The function of SMARCC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Zinc Finger Protein 192 (ZNF192, Accession NM_006298) is another VGAM142 host target gene. ZNF192 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF192, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF192 BINDING SITE, designated SEQ ID:12993, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10608] Another function of VGAM142 is therefore inhibition of Zinc Finger Protein 192 (ZNF192, Accession NM_006298). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF192. Chromosome 21 Open Reading

Frame 108 (C21orf108, Accession XM_114191) is another VGAM142 host target gene. C21orf108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf108 BINDING SITE, designated SEQ ID:42774, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10609] Another function of VGAM142 is therefore inhibition of Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM_114191). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf108. Chromosome 8 Open Reading Frame 7 (C8orf7, Accession XM_088376) is another VGAM142 host target gene. C8orf7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf7 BINDING SITE, designated SEQ

ID:39650, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10610] Another function of VGAM142 is therefore inhibition of Chromosome 8 Open Reading Frame 7 (C8orf7, Accession XM_088376). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf7. Calcium Homeostasis Endoplasmic Reticulum Protein (CHERP, Accession NM_006387) is another VGAM142 host target gene. CHERP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHERP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHERP BINDING SITE, designated SEQ ID:13092, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10611] Another function of VGAM142 is therefore inhibition of Calcium Homeostasis Endoplasmic Reticulum Protein (CHERP, Accession NM_006387). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with CHERP. FLJ12121 (Accession NM_024978) is another VGAM142 host target gene. FLJ12121 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12121 BINDING SITE, designated SEQ ID:24538, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10612] Another function of VGAM142 is therefore inhibition of FLJ12121 (Accession NM_024978). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12121. KIAA0475 (Accession NM_014864) is another VGAM142 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:16952, to the nucleotide sequence of

VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10613] Another function of VGAM142 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. KIAA1317 (Accession XM_098368) is another VGAM142 host target gene. KIAA1317 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1317 BINDING SITE, designated SEQ ID:41630, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10614] Another function of VGAM142 is therefore inhibition of KIAA1317 (Accession XM_098368). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1317. KIAA1434 (Accession XM_045585) is another VGAM142 host target gene. KIAA1434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1434 BINDING SITE, designated SEQ ID:34488, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10615] Another function of VGAM142 is therefore inhibition of KIAA1434 (Accession XM_045585). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1434. KIAA1462 (Accession XM_166132) is another VGAM142 host target gene. KIAA1462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1462 BINDING SITE, designated SEQ ID:43923, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10616] Another function of VGAM142 is therefore inhibition of KIAA1462 (Accession XM_166132). Accordingly, utilities

of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1462. KIAA1829 (Accession XM_030378) is another VGAM142 host target gene. KIAA1829 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1829 BINDING SITE, designated SEQ ID:31034, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10617] Another function of VGAM142 is therefore inhibition of KIAA1829 (Accession XM_030378). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1829. Protein Tyrosine Phosphatase, Receptor Type, R (PTPRR, Accession NM_130846) is another VGAM142 host target gene. PTPRR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTPRR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PTPRR BINDING SITE, designated SEQ ID:28382, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10618] Another function of VGAM142 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, R (PTPRR, Accession NM_130846). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRR. Transcription Factor-like 5 (basic helix-loop-helix) (TCFL5, Accession NM_006602) is another VGAM142 host target gene. TCFL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCFL5 BINDING SITE, designated SEQ ID:13381, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10619] Another function of VGAM142 is therefore inhibition of Transcription Factor-like 5 (basic helix-loop-helix) (TCFL5, Accession NM_006602). Accordingly, utilities of

VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCFL5. LOC146243 (Accession XM_096956) is another VGAM142 host target gene. LOC146243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146243 BINDING SITE, designated SEQ ID:40677, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10620] Another function of VGAM142 is therefore inhibition of LOC146243 (Accession XM_096956). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146243. LOC153129 (Accession XM_087606) is another VGAM142 host target gene. LOC153129 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC153129 BINDING SITE, designated SEQ ID:39360, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10621] Another function of VGAM142 is therefore inhibition of LOC153129 (Accession XM_087606). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153129. LOC202451 (Accession XM_117401) is another VGAM142 host target gene. LOC202451 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202451 BINDING SITE, designated SEQ ID:43441, to the nucleotide sequence of VGAM142 RNA, herein designated VGAM RNA, also designated SEQ ID:2853.

[10622] Another function of VGAM142 is therefore inhibition of LOC202451 (Accession XM_117401). Accordingly, utilities of VGAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202451. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 143 (VGAM143) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10623] VGAM143 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM143 was detected is described hereinabove with reference to Figs. 1–8.

[10624] VGAM143 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM143 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10625] VGAM143 gene encodes a VGAM143 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM143 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM143 precursor RNA is designated SEQ ID:129, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:129 is located at position 222208 relative to the genome of

Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10626] VGAM143 precursor RNA folds onto itself, forming VGAM143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10627] An enzyme complex designated DICER COMPLEX, `dices` the VGAM143 folded precursor RNA into VGAM143 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM143 RNA is designated SEQ ID:2854, and is provided hereinbelow with reference to the sequence listing part.

[10628] VGAM143 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM143 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM143 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[10629] VGAM143 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM143 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM143 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM143 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM143 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[10630] The complementary binding of VGAM143 RNA, herein designated VGAM RNA, to host target binding sites on VGAM143 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM143 host target RNA into VGAM143 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10631] It is appreciated that VGAM143 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM143 host target genes. The mRNA of each one of this plurality of VGAM143 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM143 RNA, herein designated VGAM RNA, and which when bound by VGAM143 RNA causes inhibition of translation of respective one or more VGAM143

host target proteins.

[10632] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM143 gene, herein designated VGAM GENE, on one or more VGAM143 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10633] It is yet further appreciated that a function of VGAM143 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM143 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syn-

drome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM143 correlate with, and may be deduced from, the identity of the host target genes which VGAM143 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10634] Nucleotide sequences of the VGAM143 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM143 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM143 are further described hereinbelow with reference to Table 1.

[10635] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM143 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM143 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10636] As mentioned hereinabove with reference to Fig. 1, a function of VGAM143 gene, herein designated VGAM is inhibition of expression of VGAM143 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM143 correlate with, and may be deduced from, the identity of the target genes which VGAM143 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10637] Cullin 3 (CUL3, Accession NM_003590) is a VGAM143 host target gene. CUL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CUL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUL3 BINDING SITE, designated SEQ ID:9643, to the nucleotide sequence of VGAM143 RNA, herein designated VGAM RNA, also designated SEQ ID:2854.

[10638] A function of VGAM143 is therefore inhibition of Cullin 3 (CUL3, Accession NM_003590), a gene which may target other proteins for ubiquitin-dependent proteolysis. Accordingly, utilities of VGAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL3. The function of CUL3 has been established by previous studies. Kipreos et al. (1996) identified a conserved gene family, designated cullins, with at least

5 members in nematodes, 6 in humans, and 3 in *S. cerevisiae*. See CUL1 (OMIM Ref. No. 603134). Human CUL3 is an ortholog of nematode *cul3*. Michel and Xiong (1998) identified human CUL3 cDNAs and reported that the predicted protein is 768 amino acids long. Ishikawa et al. (1998) isolated a CUL3 cDNA, KIAA0617, as 1 of 100 brain cDNAs encoding large proteins. Using RT-PCR, they found that CUL3 is expressed in several tissues. Du et al. (1998) identified CUL3 as a gene whose expression in human fibroblasts is induced by phorbol 12-myristate 13-acetate (PMA) and suppressed by salicylate. They reported that the sequences of the human and *C. elegans* *cul3* proteins share 46% identity. Northern blot analysis revealed that CUL3 is expressed as major 2.8- and minor 4.3-kb transcripts in various human tissues, with the highest levels in skeletal muscle and heart.

[10639] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10640] Du, M.; Sansores-Garcia, L.; Zu, Z.; Wu, K. K. : Cloning and expression analysis of a novel salicylate suppressible gene, Hs-CUL-3, a member of cullin/Cdc53 family. *J. Biol. Chem.* 273: 24289-24292, 1998. ; and

- [10641] Ishikawa, K.; Nagase, T.; Suyama, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. X. The complete seque.
- [10642] Further studies establishing the function and utilities of CUL3 are found in John Hopkins OMIM database record ID 603136, and in cited publications numbered 5063, 9440–944 and 5062 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BLOV1 (Accession XM_083866) is another VGAM143 host target gene. BLOV1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BLOV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLOV1 BINDING SITE, designated SEQ ID:37519, to the nucleotide sequence of VGAM143 RNA, herein designated VGAM RNA, also designated SEQ ID:2854.
- [10643] Another function of VGAM143 is therefore inhibition of BLOV1 (Accession XM_083866). Accordingly, utilities of VGAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLOV1.

FLJ10849 (Accession NM_018243) is another VGAM143 host target gene. FLJ10849 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10849, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10849 BINDING SITE, designated SEQ ID:20206, to the nucleotide sequence of VGAM143 RNA, herein designated VGAM RNA, also designated SEQ ID:2854.

[10644] Another function of VGAM143 is therefore inhibition of FLJ10849 (Accession NM_018243). Accordingly, utilities of VGAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10849. Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622) is another VGAM143 host target gene. MRPL35 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPL35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL35 BINDING SITE, designated SEQ ID:18731, to the nucleotide sequence of VGAM143 RNA,

herein designated VGAM RNA, also designated SEQ ID:2854.

- [10645] Another function of VGAM143 is therefore inhibition of Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622). Accordingly, utilities of VGAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL35. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 144 (VGAM144) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [10646] VGAM144 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM144 was detected is described hereinabove with reference to Figs. 1–8.
- [10647] VGAM144 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM144 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [10648] VGAM144 gene encodes a VGAM144 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM144 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM144 precursor RNA is designated SEQ ID:130, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:130 is located at position 93494 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10649] VGAM144 precursor RNA folds onto itself, forming VGAM144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10650] An enzyme complex designated DICER COMPLEX, `dices` the VGAM144 folded precursor RNA into VGAM144 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM144 RNA is designated SEQ ID:2855, and is provided hereinbelow with reference to the sequence listing part.

[10651] VGAM144 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM144 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM144 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10652] VGAM144 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM144 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM144 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM144 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM144 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10653] The complementary binding of VGAM144 RNA, herein designated VGAM RNA, to host target binding sites on VGAM144 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM144 host target RNA into VGAM144 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10654] It is appreciated that VGAM144 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM144 host target genes. The mRNA of each one of this plurality of VGAM144 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM144 RNA, herein designated VGAM RNA, and which when bound by VGAM144 RNA causes inhibition of translation of respective one or more VGAM144 host target proteins.

[10655] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM144 gene, herein designated VGAM GENE, on one or more VGAM144 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[10656] It is yet further appreciated that a function of VGAM144 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM144 correlate with, and may be deduced from, the identity of the host target genes which VGAM144 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10657] Nucleotide sequences of the VGAM144 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM144 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM144 are further described hereinbelow with reference to Table 1.

[10658] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM144 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM144 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10659] As mentioned hereinabove with reference to Fig. 1, a function of VGAM144 gene, herein designated VGAM is inhibition of expression of VGAM144 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM144 correlate with, and may be deduced from, the identity of the target genes which VGAM144 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10660] Axonal Transport of Synaptic Vesicles (ATSV, Accession NM_004321) is a VGAM144 host target gene. ATSV BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATSV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATSV BINDING SITE, designated SEQ ID:10520, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10661] A function of VGAM144 is therefore inhibition of Axonal Transport of Synaptic Vesicles (ATSV, Accession NM_004321), a gene which is a motor for anterograde axonal transport of synaptic vesicle precursors. Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATSV. The function of ATSV has been established by previous studies. Kinesin-related proteins constitute a large superfamily of microtubule-dependent proteins that mediate specific and diverse motile processes, including intracellular transport and cell division. The human ATSV protein is a member of the kinesin family and shows 95% identity to the KIF1A protein of mouse (Okada et al., 1995). KIF1A is an anterograde motor protein that transports membranous organelles along axonal microtubules. Its cargo includes a subset of precursors for synaptic vesicles: synaptophysin (OMIM Ref. No. 313475), synaptotagmin (OMIM Ref. No. 185605), and Rab3A (OMIM Ref. No. 179490). Animal model experiments lend further support to the function of ATSV. The phenotype of KIF1A knockout mice includes motor and sensory disturbances, a reduction in the density of synaptic vesicles in nerve terminals, and accumulation of clear vesicles in nerve cell bodies

(Yonekawa et al., 1998). It can be hypothesized that ATSV (and KIF1A in the mouse) may play a critical role in the development of axonal neuropathies resulting from impaired axonal transport.

[10662] It is appreciated that the abovementioned animal model for ATSV is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[10663] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10664] Okada, Y.; Yamazaki, H.; Sekine-Aizawa, Y.; Hirokawa, N. : The neuron-specific kinesin superfamily protein KIF1A is a unique monomeric motor for anterograde axonal transport of synaptic vesicle precursors. Cell 81: 769–780, 1995. ; and

[10665] Yonekawa, Y.; Harada, A.; Okada, Y.; Funakoshi, T.; Kanai, Y.; Takei, Y.; Terada, S.; Noda, T.; Hirokawa, N. : Defect in synaptic vesicle precursor transport and neuronal cell death in.

[10666] Further studies establishing the function and utilities of ATSV are found in John Hopkins OMIM database record ID 601255, and in cited publications numbered 9473–9479

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fanconi Anemia, Complementation Group A (FANCA, Accession NM_000135) is another VGAM144 host target gene. FANCA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FANCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCA BINDING SITE, designated SEQ ID:5628, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10667] Another function of VGAM144 is therefore inhibition of Fanconi Anemia, Complementation Group A (FANCA, Accession NM_000135). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCA. Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM_005463) is another VGAM144 host target gene. HNRPDL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPDL, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPDL BINDING SITE, designated SEQ ID:11952, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10668] Another function of VGAM144 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM_005463), a gene which binds to rna molecules that contain au-rich elements. Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPDL. The function of HNRPDL has been established by previous studies. Kamei et al. (1999) identified 2 isoforms of HNRPDL, which they called JKTBP1 and JKTBP2, corresponding to the 1.4- and 2.8-kb transcripts identified by Tsuchiya et al. (1998), respectively. The larger transcript predicts a 420-amino acid protein with a calculated molecular mass of approximately 46.4 kD. The JKTBP2 protein has a longer N terminus, and both proteins contain multiple potential sites for phosphorylation and arginine methylation. Northern blot analysis showed that both transcripts were expressed in all tissues examined,

although the amounts and ratios of the transcripts varied in different tissues. Three JKTBP transcripts greater than 2.8 kb were expressed in pancreas, spleen, and thymus. Western blot analysis of myeloid leukemia cells showed proteins of 38 and 53 kD. Tsuchiya et al. (1998) determined that recombinant HNRPDL interacted with both the double- and single-stranded forms of JKT41, an oligodeoxynucleotide corresponding to the cis-acting element in intron 9 of the MPO gene. Recombinant HNRPDL also interacted with poly(G) and poly(A), but not with poly(U) or poly(C). Transient expression of HNRPDL repressed expression of reporter genes located downstream of the intron 9 element of JKT41 or the intron 7 element of FERE27, another oligodeoxynucleotide corresponding to MPO.

[10669] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10670] Kamei, D.; Tsuchiya, N.; Yamazaki, M.; Meguro, H.; Yamada, M. : Two forms of expression and genomic structure of the human heterogeneous nuclear ribonucleoprotein D-like JKTBP gene (HNRPDL). *Gene* 228: 13-22, 1999.
; and

[10671] Tsuchiya, N.; Kamei, D.; Takano, A.; Matsui, T.; Yamada, M. : Cloning and characterization of a cDNA encoding a novel heterogeneous nuclear ribonucleoprotein-like protein and its expressio.

[10672] Further studies establishing the function and utilities of HNRPDL are found in John Hopkins OMIM database record ID 607137, and in cited publications numbered 6085–6087 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 13 Receptor, Alpha 1 (IL13RA1, Accession NM_001560) is another VGAM144 host target gene. IL13RA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL13RA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL13RA1 BINDING SITE, designated SEQ ID:7282, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10673] Another function of VGAM144 is therefore inhibition of Interleukin 13 Receptor, Alpha 1 (IL13RA1, Accession NM_001560), a gene which binds il-13 with a low affinity.

together with il-4r- alpha can form a functional receptor for il-13. Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL13RA1. The function of IL13RA1 has been established by previous studies. Interleukin-4 (IL4; 147780) and interleukin-13 (IL13; 147683) are 2 cytokines that are secreted by activated T cells and have similar effects on monocytes and B cells. Zurawski et al. (1993) demonstrated that the IL4 receptor (OMIM Ref. No. 147781) is a complex of at least 2 components. They described a mutant form of human IL4 that competitively antagonizes both human IL4 and human IL13. The amino acid sequences of IL4 and IL13 are approximately 30% homologous, and circular dichroism spectroscopy demonstrates that both proteins have a highly alpha-helical structure. IL13 competitively inhibited binding of IL4 to functional human IL4 receptors expressed on a cell line that responds to both IL4 and IL13. The binding of IL4 to an IL4-responsive cell line that does not respond to IL13, and the binding of IL4 to cloned IL4R ligand binding protein expressed on heterologous cells, were not inhibited by IL13. The results demonstrated that IL4 and IL13 share a receptor component that is important for signal trans-

duction. Hilton et al. (1996) reviewed these and other data suggesting a model of IL4 and IL13 receptor composition and function Heinzmann et al. (2000) determined that a variant of human IL13 (OMIM Ref. No. 147683), arg110 to gln (OMIM Ref. No. A4464G), associated with asthma in case-control populations from Britain and Japan (peak odds ratio (OR) = 2.31, 95% confidence interval, 1.33 – 4.00); the variant also predicted asthma and higher serum IL13 levels in a general, Japanese pediatric population. The authors referred to this variant as gln110 to arg. Immunohistochemistry demonstrated that both subunits of IL13R are prominently expressed in bronchial epithelium and smooth muscle from asthmatic subjects. Detailed molecular modeling analyses indicated that residue 110 of IL13 is important in the internal constitution of the ligand and crucial in ligand-receptor interaction. A noncoding variant of IL13R-alpha 1, 1398A-G, associated primarily with high IgE levels (OR = 3.38 in males, 1.10 in females) rather than asthma

[10674] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10675] Hilton, D. J.; Zhang, J.-G.; Metcalf, D.; Alexander, W. S.;

Nicola, N. A.; Willson, T. A. : Cloning and characterization of a binding subunit of the interleukin 13 receptor that is also a component of the interleukin 4 receptor. Proc. Nat. Acad. Sci. 93: 497–501, 1996. ; and

[10676] Heinzmann, H.; Mao, X.-Q.; Akaiwa, M.; Kreomer, R. T.; Gao, P.-S.; Ohshima, K.; Umeshita, R.; Abe, Y.; Braun, S.; Yamashita, T.; Roberts, M. H.; Sugimoto, R.; and 20 others : Genetic var.

[10677] Further studies establishing the function and utilities of IL13RA1 are found in John Hopkins OMIM database record ID 300119, and in cited publications numbered 10630–10631, 687, 1063 and 11592 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 1 Receptor Accessory Protein (IL1RAP, Accession NM_002182) is another VGAM144 host target gene. IL1RAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL1RAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RAP BINDING SITE, designated SEQ ID:7940, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2855.

[10678] Another function of VGAM144 is therefore inhibition of Interleukin 1 Receptor Accessory Protein (IL1RAP, Accession NM_002182), a gene which may function as a membrane receptor. promotes heterophilic cellular adhesion. Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RAP. The function of IL1RAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM142. Kelch-like 3 (Drosophila) (KLHL3, Accession XM_113450) is another VGAM144 host target gene. KLHL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL3 BINDING SITE, designated SEQ ID:42271, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10679] Another function of VGAM144 is therefore inhibition of Kelch-like 3 (Drosophila) (KLHL3, Accession XM_113450).

Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL3. Methionine Adenosyltransferase I, Alpha (MAT1A, Accession XM_165540) is another VGAM144 host target gene. MAT1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAT1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAT1A BINDING SITE, designated SEQ ID:43666, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10680] Another function of VGAM144 is therefore inhibition of Methionine Adenosyltransferase I, Alpha (MAT1A, Accession XM_165540). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAT1A. N-myc Downstream Regulated Gene 1 (NDRG1, Accession XM_005243) is another VGAM144 host target gene. NDRG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDRG1, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG1 BINDING SITE, designated SEQ ID:29965, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10681] Another function of VGAM144 is therefore inhibition of N-myc Downstream Regulated Gene 1 (NDRG1, Accession XM_005243), a gene which may have a growth inhibitory role. Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG1. The function of NDRG1 has been established by previous studies. Using mRNA differential display analysis to compare expression in cells cultured in the presence of 1% or 20% oxygen, Park et al. (2000) determined that NDRG1, which they called PROXY1, is markedly upregulated in hypoxic cells. Northern and Western blot analyses showed that the 43-kD NDRG1 protein has a longer half-life than does the mRNA transcript and that the upregulation occurs through a heme protein-dependent pathway. Autosomal recessive peripheral neuropathies are relatively rare but are clinically more severe than autosomal dominant forms of Charcot-Marie-Tooth disease (CMT). The Lom form of hereditary motor and

sensory neuropathy (HMSNL; 601455), or CMT4D, is one such disorder. HMSNL shows features of Schwann cell dysfunction and a concomitant early axonal involvement, suggesting that impaired axon–glia interactions play a major role in its pathogenesis. Kalaydjieva et al. (1996) mapped the disease gene to 8q24.3, where closely related disease haplotypes and strong linkage disequilibrium suggested a single founder mutation. Kalaydjieva et al. (2000) reduced the HMSNL interval to 200 kb and characterized it by means of large–scale genomic sequencing. Sequence analysis of 2 genes located in the critical region, NDRG1 and WISP1 (OMIM Ref. No. 603398), identified the founder HMSNL mutation, a nonsense arg148–to–ter mutation (605262.0001) in the NDRG1 gene.

[10682] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10683] Kalaydjieva, L.; Gresham, D.; Gooding, R.; Heather, L.; Baas, F.; de Jonge, R.; Blechschmidt, K.; Angelicheva, D.; Chandler, D.; Worsley, P.; Rosenthal, A.; King, R. H. M.; Thomas, P. K. : N–myc downstream–regulated gene 1 is mutated in hereditary motor and sensory neuropathy–Lom. Am. J. Hum. Genet. 67: 47–58, 2000. ; and

[10684] Park, H.; Adams, M. A.; Lachat, P.; Bosman, F.; Pang, S. C.; Graham, C. H. : Hypoxia induces the expression of a 43-kDa protein (PROXY-1) in normal and malignant cells. Biochem. Bioph.

[10685] Further studies establishing the function and utilities of NDRG1 are found in John Hopkins OMIM database record ID 605262, and in cited publications numbered 1353-135 and 2318-2322 listed in the bibliography section herein-below, which are also hereby incorporated by reference. Solute Carrier Family 7 (cationic amino acid transporter, y⁺ system), Member 6 (SLC7A6, Accession NM_003983) is another VGAM144 host target gene. SLC7A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:10126, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10686] Another function of VGAM144 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter,

y+ system), Member 6 (SLC7A6, Accession NM_003983), a gene which is involved in mediating amino acid transport. Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6. The function of SLC7A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM87. Transgelin 2 (TAGLN2, Accession NM_003564) is another VGAM144 host target gene. TAGLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAGLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAGLN2 BINDING SITE, designated SEQ ID:9620, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10687] Another function of VGAM144 is therefore inhibition of Transgelin 2 (TAGLN2, Accession NM_003564), a gene which is similar to transgelins and may be an actin-binding proteins. Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with TAGLN2. The function of TAGLN2 has been established by previous studies. By sequencing cDNAs randomly selected from a cDNA library derived from a human immature myeloid cell line, Nagase et al. (1995) isolated a cDNA encoding TAGLN2, which they called KIAA0120. The deduced 199-amino acid TAGLN2 protein shares 69.7% amino acid sequence identity with rat neuronal protein NP25 over 195 amino acids. Northern blot analysis detected TAGLN2 expression in all 16 human tissues examined, with high expression in lung, liver, kidney, spleen, thymus, small intestine, colon, prostate, testis, ovary, placenta, and peripheral blood leukocytes, lower expression in skeletal muscle, pancreas, and heart, and lowest expression in brain. Using a somatic cell hybrid mapping panel, Nagase et al. (1995) determined that the TAGLN2 gene maps to either chromosome 1 or 8. Stanier et al. (1998) noted that an EST cluster representing the TAGLN2 gene had been mapped to 1q21-q25. By linkage analysis, Stanier et al. (1998) mapped the mouse Tagln2 gene to distal chromosome 1, between the Fcgr2 gene (OMIM Ref. No. 146790) and marker D1Mit149. Distal mouse chromosome 1 shows homology of synteny with human 1q21-q25.

[10688] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10689] Nagase, T.; Miyajima, N.; Tanaka, A.; Sazuka, T.; Seki, N.; Sato, S.; Tabata, S.; Ishikawa, K.; Kawarabayasi, Y.; Kotani, H.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. III. The coding sequences of 40 new genes (KIAA0081–KIAA0120) deduced by analysis of cDNA clones from human cell line KG–1. DNA Res. 2: 37–43, 1995. ; and

[10690] Stanier, P.; Abu–Hayyeh, S.; Murdoch, J. N.; Eddleston, J.; Copp, A. J. : Paralogous Sm22–alpha (Tagln) genes map to mouse chromosomes 1 and 9: further evidence for a paralogous relatio.

[10691] Further studies establishing the function and utilities of TAGLN2 are found in John Hopkins OMIM database record ID 604634, and in cited publications numbered 108 and 7526 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transcription Factor 3 (E2A immunoglobulin enhancer binding factors E12/E47) (TCF3, Accession XM_047600) is another VGAM144 host target gene. TCF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by TCF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF3 BINDING SITE, designated SEQ ID:35005, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10692] Another function of VGAM144 is therefore inhibition of Transcription Factor 3 (E2A immunoglobulin enhancer binding factors E12/E47) (TCF3, Accession XM_047600), a gene which plays major roles in determining tissue-specific cell fate during embryogenesis. Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF3. The function of TCF3 has been established by previous studies. Expression of immunoglobulin genes depends on various sequence motifs in their enhancer and promoter regions. One class of such sequences is the 'E boxes,' which are found in both heavy and light chain enhancers. The kappa-E2 site has been shown to be important for light chain gene transcription. Studies have demonstrated that E boxes are binding sites for proteins. To isolate cDNAs encoding kappa-E2-binding proteins, Murre et al.

(1989) screened a cDNA expression library derived from a human B-cell lymphoma cell line (BJAB) with an oligonucleotide containing a trimerized kappa-E2 site. They identified a partial cDNA encoding a protein that they designated E12. Using the E12 cDNA to rescreen the BJAB cDNA library, Murre et al. (1989) isolated a partial cDNA encoding a protein that they designated E47. The authors showed that both E12 and E47 bind specifically to the kappa-E2 sequence. They demonstrated that E47 binds kappa-E2 as a dimer in vitro. Sequence analysis suggested that E12 and E47 are derived from a single gene, called E2A or TCF3, via alternative splicing. E12 contains a leucine zipper; the corresponding region of E47 was not cloned. Both the E12 and E47 proteins contain a region that is homologous to regions in MYOD (OMIM Ref. No. 159970), members of the MYC family (e.g., 190080), the Drosophila 'daughterless' gene product, and products of the Drosophila 'achaete-scute' and 'twist' gene families. The homologous regions have the potential to form 2 amphipathic helices separated by an intervening loop. The hydrophobic residues present in the helices are highly conserved. The authors demonstrated that this helix-loop-helix motif plays a crucial role in both dimerization

and DNA binding. Animal model experiments lend further support to the function of TCF3. Heterodimers between tissue-specific basic helix-loop-helix (bHLH) proteins and the products of the E2A gene play major roles in determining tissue-specific cell fate. The E2A gene gives rise to 2 proteins, E12 and E47, by differential splicing of E12- and E47-specific bHLH-encoding exons. Although they were initially identified in B cells as immunoglobulin enhancer-binding proteins, they were subsequently found to be present in most cell types. To understand the broad role of E2A in development, Zhuang et al. (1994) generated E2A mutant mice following homologous recombination in embryonic stem cells. Homozygous mutant mice developed to full term without apparent abnormalities, but then displayed a high rate of postnatal death. The surviving mice showed retarded postnatal growth. Detailed examination of hematopoiesis revealed that the homozygous mutant mice contained no B cells, whereas other lineages, including the T cell, granulocyte, macrophage, and erythroid lineages, were intact. The block to B-cell differentiation occurred before the immunoglobulin gene D(H)-J(H) rearrangement. Surprisingly, heterozygous embryos contained, on average, about half

as many B cells as did wildtype embryos, suggesting the existence of a counting mechanism that translates levels of E2A into numbers of B cells. Sun (1994) generated transgenic mice in which the Id1 gene (OMIM Ref. No. 600349) was constitutively overexpressed in the B-cell lineage. The product of this gene is an inhibitor of the DNA-binding activity of bHLH proteins such as the E2A gene product. The phenotype of these transgenic mice depicted severe defects in early B-cell development, suggesting that the bHLH proteins play pivotal roles in B-cell development and that the downregulation of Id1 gene expression is necessary for B cells to differentiate.

[10693] It is appreciated that the abovementioned animal model for TCF3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[10694] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10695] Murre, C.; McCaw, P. S.; Baltimore, D. : Cell 56: 777-783, 1989. ; and

[10696] Sun, X.-H. : Constitutive expression of the Id1 gene impairs mouse B cell development. Cell 79: 893-900, 1994.

[10697] Further studies establishing the function and utilities of TCF3 are found in John Hopkins OMIM database record ID 147141, and in cited publications numbered 11901–11903, 5203–5205, 11904–11907, 520 and 11351 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 20D7–FC4 (Accession XM_027578) is another VGAM144 host target gene. 20D7–FC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by 20D7–FC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of 20D7–FC4 BINDING SITE, designated SEQ ID:30538, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10698] Another function of VGAM144 is therefore inhibition of 20D7–FC4 (Accession XM_027578). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with 20D7–FC4. Acetyl–Coenzyme A Synthetase 2 (ADP forming) (ACAS2, Accession NM_018677) is another VGAM144 host target gene. ACAS2 BINDING SITE1 and ACAS2 BIND–

ING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ACAS2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACAS2 BINDING SITE1 and ACAS2 BINDING SITE2, designated SEQ ID:20751 and SEQ ID:29264 respectively, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10699] Another function of VGAM144 is therefore inhibition of Acetyl-Coenzyme A Synthetase 2 (ADP forming) (ACAS2, Accession NM_018677). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACAS2. Calsyntenin 3 (CLSTN3, Accession NM_014718) is another VGAM144 host target gene. CLSTN3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CLSTN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLSTN3 BINDING SITE, designated SEQ ID:16273, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2855.

[10700] Another function of VGAM144 is therefore inhibition of Calsyntenin 3 (CLSTN3, Accession NM_014718). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLSTN3. CCR4–NOT Transcription Complex, Subunit 8 (CNOT8, Accession NM_004779) is another VGAM144 host target gene. CNOT8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNOT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT8 BINDING SITE, designated SEQ ID:11180, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10701] Another function of VGAM144 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 8 (CNOT8, Accession NM_004779). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT8. FBP17 (Accession XM_052666) is another VGAM144 host target gene. FBP17 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by FBP17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBP17 BINDING SITE, designated SEQ ID:36047, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10702] Another function of VGAM144 is therefore inhibition of FBP17 (Accession XM_052666). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBP17. FLJ12671 (Accession NM_030980) is another VGAM144 host target gene. FLJ12671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12671 BINDING SITE, designated SEQ ID:25242, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10703] Another function of VGAM144 is therefore inhibition of

FLJ12671 (Accession NM_030980). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12671. FLJ20294 (Accession NM_017749) is another VGAM144 host target gene. FLJ20294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294 BINDING SITE, designated SEQ ID:19345, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10704] Another function of VGAM144 is therefore inhibition of FLJ20294 (Accession NM_017749). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20294. FLJ23510 (Accession NM_024720) is another VGAM144 host target gene. FLJ23510 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ23510 BINDING SITE, designated SEQ ID:24051, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10705] Another function of VGAM144 is therefore inhibition of FLJ23510 (Accession NM_024720). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23510. Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM_021903) is another VGAM144 host target gene. GABBR1 BINDING SITE1 and GABBR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GABBR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE1 and GABBR1 BINDING SITE2, designated SEQ ID:22420 and SEQ ID:7204 respectively, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10706] Another function of VGAM144 is therefore inhibition of Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM_021903). Accordingly, utilities of VGAM144

include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_015044) is another VGAM144 host target gene. GGA2 BINDING SITE1 and GGA2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GGA2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE1 and GGA2 BINDING SITE2, designated SEQ ID:17397 and SEQ ID:30450 respectively, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10707] Another function of VGAM144 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_015044). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2. KIAA0703 (Accession NM_014861) is another VGAM144 host target gene. KIAA0703 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by KIAA0703, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0703 BINDING SITE, designated SEQ ID:16929, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10708] Another function of VGAM144 is therefore inhibition of KIAA0703 (Accession NM_014861). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0703. KIAA1872 (Accession XM_031917) is another VGAM144 host target gene. KIAA1872 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1872 BINDING SITE, designated SEQ ID:31517, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10709] Another function of VGAM144 is therefore inhibition of KIAA1872 (Accession XM_031917). Accordingly, utilities

of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1872. LSFR2 (Accession XM_026945) is another VGAM144 host target gene. LSFR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LSFR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LSFR2 BINDING SITE, designated SEQ ID:30378, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10710] Another function of VGAM144 is therefore inhibition of LSFR2 (Accession XM_026945). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LSFR2. MGC10818 (Accession NM_030568) is another VGAM144 host target gene. MGC10818 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC10818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10818 BINDING

SITE, designated SEQ ID:24939, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10711] Another function of VGAM144 is therefore inhibition of MGC10818 (Accession NM_030568). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10818. RIP60 (Accession NM_013400) is another VGAM144 host target gene. RIP60 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RIP60, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIP60 BINDING SITE, designated SEQ ID:15059, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10712] Another function of VGAM144 is therefore inhibition of RIP60 (Accession NM_013400). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIP60. LOC122786 (Accession XM_058660) is another VGAM144 host target gene. LOC122786 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of mRNA encoded by LOC122786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122786 BINDING SITE, designated SEQ ID:36699, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10713] Another function of VGAM144 is therefore inhibition of LOC122786 (Accession XM_058660). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122786. LOC147136 (Accession XM_085716) is another VGAM144 host target gene. LOC147136 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147136 BINDING SITE, designated SEQ ID:38299, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10714] Another function of VGAM144 is therefore inhibition of

LOC147136 (Accession XM_085716). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147136. LOC158267 (Accession XM_088528) is another VGAM144 host target gene. LOC158267 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158267 BINDING SITE, designated SEQ ID:39792, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10715] Another function of VGAM144 is therefore inhibition of LOC158267 (Accession XM_088528). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158267. LOC164714 (Accession XM_104657) is another VGAM144 host target gene. LOC164714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC164714 BINDING SITE, designated SEQ ID:42174, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10716] Another function of VGAM144 is therefore inhibition of LOC164714 (Accession XM_104657). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164714. LOC199796 (Accession XM_058994) is another VGAM144 host target gene. LOC199796 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199796 BINDING SITE, designated SEQ ID:36808, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10717] Another function of VGAM144 is therefore inhibition of LOC199796 (Accession XM_058994). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199796. LOC220522 (Accession XM_018306) is an-

other VGAM144 host target gene. LOC220522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220522 BINDING SITE, designated SEQ ID:30353, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10718] Another function of VGAM144 is therefore inhibition of LOC220522 (Accession XM_018306). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220522. LOC222031 (Accession XM_168371) is another VGAM144 host target gene. LOC222031 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222031 BINDING SITE, designated SEQ ID:45134, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10719] Another function of VGAM144 is therefore inhibition of LOC222031 (Accession XM_168371). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222031. LOC253573 (Accession XM_173110) is another VGAM144 host target gene. LOC253573 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253573 BINDING SITE, designated SEQ ID:46365, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10720] Another function of VGAM144 is therefore inhibition of LOC253573 (Accession XM_173110). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253573. LOC91380 (Accession XM_038134) is another VGAM144 host target gene. LOC91380 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91380, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91380 BINDING SITE, designated SEQ ID:32755, to the nucleotide sequence of VGAM144 RNA, herein designated VGAM RNA, also designated SEQ ID:2855.

[10721] Another function of VGAM144 is therefore inhibition of LOC91380 (Accession XM_038134). Accordingly, utilities of VGAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91380. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 145 (VGAM145) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10722] VGAM145 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM145 was detected is described hereinabove with reference to Figs. 1–8.

[10723] VGAM145 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM145 host

target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10724] VGAM145 gene encodes a VGAM145 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM145 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM145 precursor RNA is designated SEQ ID:131, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:131 is located at position 279445 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10725] VGAM145 precursor RNA folds onto itself, forming VGAM145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10726] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM145 folded precursor RNA into VGAM145 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM145 RNA is designated SEQ ID:2856, and is provided hereinbelow with reference to the sequence listing part.

[10727] VGAM145 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM145 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM145 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10728] VGAM145 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM145 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM145 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM145 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM145 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10729] The complementary binding of VGAM145 RNA, herein designated VGAM RNA, to host target binding sites on VGAM145 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM145 host target RNA into VGAM145 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10730] It is appreciated that VGAM145 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM145 host target genes. The mRNA of each one of this plurality of VGAM145 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM145 RNA, herein designated VGAM RNA, and which when bound by VGAM145 RNA causes inhibition of translation of respective one or more VGAM145 host target proteins.

[10731] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM145 gene, herein designated VGAM GENE, on one or more VGAM145 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10732] It is yet further appreciated that a function of VGAM145 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM145 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM145 correlate with, and may be deduced from, the identity of the host target genes which VGAM145 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10733] Nucleotide sequences of the VGAM145 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM145 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM145 are further

described hereinbelow with reference to Table 1.

[10734] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM145 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM145 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10735] As mentioned hereinabove with reference to Fig. 1, a function of VGAM145 gene, herein designated VGAM is inhibition of expression of VGAM145 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM145 correlate with, and may be deduced from, the identity of the target genes which VGAM145 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10736] Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM_001228) is a VGAM145 host target gene. CASP8 BINDING SITE1 through CASP8 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CASP8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementar-

ity of the nucleotide sequences of CASP8 BINDING SITE1 through CASP8 BINDING SITE4, designated SEQ ID:6896, SEQ ID:27201, SEQ ID:27203 and SEQ ID:27204 respectively, to the nucleotide sequence of VGAM145 RNA, herein designated VGAM RNA, also designated SEQ ID:2856.

[10737] A function of VGAM145 is therefore inhibition of Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM_001228), a gene which is an apoptosis-related caspase and an upstream component of Fas receptor and tumor necrosis factor (TNF) receptor-induced apoptosis. Accordingly, utilities of VGAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP8. The function of CASP8 has been established by previous studies. Expression of cDNAs that encode truncated polypeptides containing mostly expanded polyglutamine repeats, but not of those that encode the corresponding full-length proteins, has been shown to induce cell death by apoptosis. Such truncated proteins have been shown to form aggregates or inclusions (Ikeda et al., 1996). Sanchez et al. (1999) studied the role of caspases in polyglutamine-induced cell death in established cultures of primary cortical, striatal, and

cerebellar neurons from embryonic day 17 rat embryos, transfected with an expression construct encoding truncated ataxin-3 that contained 79 glutamine (Q79) residues. The authors showed that the apoptosis inhibitors Bcl2, CrmA, and a truncated Fas/APO1-associated death domain protein (FADD DN) inhibited polyglutamine repeat-induced neuronal cell death. A mutant Jurkat cell line specifically lacking caspase-8 was resistant to polyglutamine-induced cell death. Cells transfected with Q79 showed insoluble inclusions. Caspase-8 was recruited and activated by these Q79 inclusions. Western blot analysis revealed the presence of activated caspase-8 in the insoluble fraction of affected brain regions from Huntington disease (OMIM Ref. No. 143100) patients but not in those from controls. The authors suggested that caspase-8 has an essential role in Huntington-related neurodegenerative diseases. Animal model experiments lend further support to the function of CASP8. Varfolomeev et al. (1998) generated mice deficient in Casp8 by disrupting exons 1 and 2, which encode the N-terminal death effector domains (DEDs) that interact with MORT1/FADD (OMIM Ref. No. 602457). Whereas wildtype and heterozygous mice appeared normal, no homozygous mutant mice survived be-

yond approximately embryonic day 13.5. Histopathologic analysis revealed marked abdominal hyperemia with erythrocytosis in the liver, major blood vessels, capillaries, and other organs. Cardiac ventricular musculature was thin and similar to early mesenchyme. Colony forming assays showed that hemopoietic precursor cells were markedly reduced in the mutant mice. Immunoprecipitation and Western blot analysis indicated that fibroblasts from mutant mice responded normally to the noncytotoxic effects of tumor necrosis factor receptor (TNFR; 191190) and death receptor-3 (DR3, or TNFRSF12; 603366) stimulation, whereas wildtype fibroblasts were killed by TNF (OMIM Ref. No. 191160) treatment or FAS (TNFRSF6; 134637) cross-linking. Agents such as ultraviolet irradiation and protein kinase inhibitors were lethal for mutant and normal fibroblasts. Varfolomeev et al. (1998) concluded that CASP8 is necessary for death induction by receptors of the TNF/nerve growth factor (see OMIM Ref. No. NGFR; 162010) family and is vital in embryonal development.

[10738] It is appreciated that the abovementioned animal model for CASP8 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[10739] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10740] Sanchez, I.; Xu, C.-J.; Juo, P.; Kakizaka, A.; Blenis, J.; Yuan, J. : Caspase-8 is required for cell death induced by expanded polyglutamine repeats. Neuron 22: 623-633, 1999. ; and

[10741] Varfolomeev, E. E.; Schuchmann, M.; Luria, V.; Chianilkulchai, N.; Beckmann, J. S.; Mett, I. L.; Rebrikov, D.; Brodianski, V. M.; Kemper, O. C.; Kollet, O.; Lapidot, T.; Soffer, D.; So.

[10742] Further studies establishing the function and utilities of CASP8 are found in John Hopkins OMIM database record ID 601763, and in sited publications numbered 6718, 7119, 1127 and 12074-6722 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ARNTL2 (Accession NM_020183) is another VGAM145 host target gene. ARNTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARNTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of ARNTL2 BINDING SITE, designated SEQ ID:21411, to the nucleotide sequence of VGAM145 RNA, herein designated VGAM RNA, also designated SEQ ID:2856.

[10743] Another function of VGAM145 is therefore inhibition of ARNTL2 (Accession NM_020183). Accordingly, utilities of VGAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNTL2. SEC24 Related Gene Family, Member B (*S. cerevisiae*) (SEC24B, Accession NM_006323) is another VGAM145 host target gene. SEC24B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC24B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC24B BINDING SITE, designated SEQ ID:13016, to the nucleotide sequence of VGAM145 RNA, herein designated VGAM RNA, also designated SEQ ID:2856.

[10744] Another function of VGAM145 is therefore inhibition of SEC24 Related Gene Family, Member B (*S. cerevisiae*) (SEC24B, Accession NM_006323). Accordingly, utilities of VGAM145 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SEC24B. LOC138639 (Accession XM_059988) is another VGAM145 host target gene. LOC138639 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC138639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138639 BINDING SITE, designated SEQ ID:37139, to the nucleotide sequence of VGAM145 RNA, herein designated VGAM RNA, also designated SEQ ID:2856.

[10745] Another function of VGAM145 is therefore inhibition of LOC138639 (Accession XM_059988). Accordingly, utilities of VGAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138639. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 146 (VGAM146) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10746] VGAM146 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM146 was detected is described hereinabove with reference to Figs. 1–8.

[10747] VGAM146 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM146 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10748] VGAM146 gene encodes a VGAM146 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM146 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM146 precursor RNA is designated SEQ ID:132, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:132 is located at position 187726 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10749] VGAM146 precursor RNA folds onto itself, forming VGAM146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10750] An enzyme complex designated DICER COMPLEX, `dices` the VGAM146 folded precursor RNA into VGAM146 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM146 RNA is designated SEQ ID:2857, and is provided hereinbelow with reference to the sequence listing part.

[10751] VGAM146 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM146 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM146 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[10752] VGAM146 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM146 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM146 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM146 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM146 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10753] The complementary binding of VGAM146 RNA, herein designated VGAM RNA, to host target binding sites on VGAM146 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM146 host target RNA into VGAM146 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10754] It is appreciated that VGAM146 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM146 host target genes. The mRNA of each one of this plurality of VGAM146 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM146 RNA, herein designated VGAM RNA, and which when bound by VGAM146 RNA causes inhibition of translation of respective one or more VGAM146 host target proteins.

[10755] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM146 gene, herein designated VGAM GENE, on one or more VGAM146 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10756] It is yet further appreciated that a function of VGAM146 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM146 correlate with, and may be deduced from, the identity of the host target genes which VGAM146 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [10757] Nucleotide sequences of the VGAM146 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM146 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM146 are further described hereinbelow with reference to Table 1.
- [10758] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM146 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM146 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [10759] As mentioned hereinabove with reference to Fig. 1, a function of VGAM146 gene, herein designated VGAM is inhibition of expression of VGAM146 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM146 correlate with, and may be deduced from, the identity of the target genes which VGAM146 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [10760] Bromodomain Adjacent to Zinc Finger Domain, 2B (BAZ2B,

Accession NM_013450) is a VGAM146 host target gene. BAZ2B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BAZ2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAZ2B BINDING SITE, designated SEQ ID:15126, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10761] A function of VGAM146 is therefore inhibition of Bromodomain Adjacent to Zinc Finger Domain, 2B (BAZ2B, Accession NM_013450). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ2B. Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_080706) is another VGAM146 host target gene. TRPV1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TRPV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPV1 BINDING SITE, designated SEQ

ID:28012, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10762] Another function of VGAM146 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_080706), a gene which functions as a receptor for capsaicin. Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV1. The function of TRPV1 has been established by previous studies. Chuang et al. (2001) demonstrated that bradykinin- or NGF-mediated potentiation of thermal sensitivity in vivo requires expression of VR1, a heat-activated ion channel on sensory neurons. Diminution of plasma membrane phosphatidylinositol-4,5,bisphosphate levels through antibody sequestration or PLC-mediated hydrolysis mimics the potentiating effects of bradykinin or NGF at the cellular level. Moreover, recruitment of PLC-gamma (OMIM Ref. No. 172420) to TRK-alpha (OMIM Ref. No. 191315) is essential for NGF-mediated potentiation of channel activity, and biochemical studies suggested that VR1 associates with this complex. Chuang et al. (2001) concluded that their studies delineate a biochemical

mechanism through which bradykinin and NGF produce hypersensitivity and might explain how the activation of PLC signaling systems regulates other members of the TRP channel family. Animal model experiments lend further support to the function of TRPV1. Caterina et al. (2000) generated mice deficient in VR1 by targeted disruption. VR1 $-/-$ mice were viable, fertile, and largely indistinguishable from wildtype littermates. Caterina et al. (2000) demonstrated that sensory neurons from mice lacking VR1 are severely deficient in their responses to vanilloid compounds, protons, or heat greater than 43 degrees C. VR1 $-/-$ mice showed normal responses to noxious mechanical stimuli but exhibited no vanilloid-evoked pain behavior, were impaired in the detection of painful heat, and showed little thermal hypersensitivity in the setting of inflammation. Thus, Caterina et al. (2000) concluded that VR1 is essential for selective modalities of pain sensation and for tissue injury-induced thermal hyperalgesia.

[10763] It is appreciated that the abovementioned animal model for TRPV1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[10764] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10765] Chuang, H.; Prescott, E. D.; Kong, H.; Shields, S.; Jordt, S.-E.; Basbaum, A. I.; Chao, M. V.; Julius, D. : Bradykinin and nerve growth factor release the capsaicin receptor from PtdIns(4,5)P₂-mediated inhibition. *Nature* 411: 957-962, 2001. ; and

[10766] Caterina, M. J.; Leffler, A.; Malmberg, A. B.; Martin, W. J.; Trafton, J.; Petersen-Zeltz, K. R.; Koltzenburg, M.; Basbaum, A. I.; Julius, D. : Impaired nociception and pain sensation in m.

[10767] Further studies establishing the function and utilities of TRPV1 are found in John Hopkins OMIM database record ID 602076, and in cited publications numbered 702, 1300-1301, 2236-1304, 1547-130 and 9434 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BNIP-S (Accession NM_138278) is another VGAM146 host target gene. BNIP-S BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BNIP-S, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of BNIP-S BINDING SITE, designated SEQ ID:28692, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10768] Another function of VGAM146 is therefore inhibition of BNIP-S (Accession NM_138278). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BNIP-S. FLJ10661 (Accession NM_018172) is another VGAM146 host target gene. FLJ10661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10661 BINDING SITE, designated SEQ ID:19996, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10769] Another function of VGAM146 is therefore inhibition of FLJ10661 (Accession NM_018172). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10661. GW112 (Accession NM_006418) is another VGAM146 host

target gene. GW112 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GW112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GW112 BINDING SITE, designated SEQ ID:13128, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10770] Another function of VGAM146 is therefore inhibition of GW112 (Accession NM_006418). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GW112. MGC10812 (Accession NM_031425) is another VGAM146 host target gene. MGC10812 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10812 BINDING SITE, designated SEQ ID:25409, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10771] Another function of VGAM146 is therefore inhibition of MGC10812 (Accession NM_031425). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10812. MGC16279 (Accession NM_032916) is another VGAM146 host target gene. MGC16279 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC16279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16279 BINDING SITE, designated SEQ ID:26731, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10772] Another function of VGAM146 is therefore inhibition of MGC16279 (Accession NM_032916). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16279. PME-1 (Accession NM_016147) is another VGAM146 host target gene. PME-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PME-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PME-1 BINDING SITE, designated SEQ ID:18233, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10773] Another function of VGAM146 is therefore inhibition of PME-1 (Accession NM_016147). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PME-1. Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM_144564) is another VGAM146 host target gene. SLC39A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC39A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC39A3 BINDING SITE, designated SEQ ID:29360, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10774] Another function of VGAM146 is therefore inhibition of Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM_144564). Accordingly, utilities of

VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC39A3. LOC158490 (Accession XM_088585) is another VGAM146 host target gene. LOC158490 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158490, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158490 BINDING SITE, designated SEQ ID:39850, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10775] Another function of VGAM146 is therefore inhibition of LOC158490 (Accession XM_088585). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158490. LOC220073 (Accession XM_167847) is another VGAM146 host target gene. LOC220073 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC220073 BINDING SITE, designated SEQ ID:44876, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10776] Another function of VGAM146 is therefore inhibition of LOC220073 (Accession XM_167847). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220073. LOC90630 (Accession XM_033046) is another VGAM146 host target gene. LOC90630 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90630 BINDING SITE, designated SEQ ID:31826, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10777] Another function of VGAM146 is therefore inhibition of LOC90630 (Accession XM_033046). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90630. LOC91069 (Accession XM_035824) is another VGAM146 host target gene. LOC91069 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91069 BINDING SITE, designated SEQ ID:32348, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10778] Another function of VGAM146 is therefore inhibition of LOC91069 (Accession XM_035824). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91069. LOC92095 (Accession XM_042811) is another VGAM146 host target gene. LOC92095 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92095, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92095 BINDING SITE, designated SEQ ID:33774, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10779] Another function of VGAM146 is therefore inhibition of

LOC92095 (Accession XM_042811). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92095. LOC92096 (Accession XM_042812) is another VGAM146 host target gene. LOC92096 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92096 BINDING SITE, designated SEQ ID:33778, to the nucleotide sequence of VGAM146 RNA, herein designated VGAM RNA, also designated SEQ ID:2857.

[10780] Another function of VGAM146 is therefore inhibition of LOC92096 (Accession XM_042812). Accordingly, utilities of VGAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92096. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 147 (VGAM147) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[10781] VGAM147 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM147 was detected is described hereinabove with reference to Figs. 1–8.

[10782] VGAM147 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM147 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10783] VGAM147 gene encodes a VGAM147 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM147 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM147 precursor RNA is designated SEQ ID:133, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:133 is located at position 82267 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10784] VGAM147 precursor RNA folds onto itself, forming VGAM147 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[10785] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM147 folded precursor RNA into VGAM147 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 60%) nucleotide se-
quence of VGAM147 RNA is designated SEQ ID:2858, and
is provided hereinbelow with reference to the sequence
listing part.

[10786] VGAM147 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM147 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM147 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10787] VGAM147 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM147 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM147 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM147 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM147 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10788] The complementary binding of VGAM147 RNA, herein designated VGAM RNA, to host target binding sites on VGAM147 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM147 host target RNA into VGAM147 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10789] It is appreciated that VGAM147 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM147 host target genes. The mRNA of each one of this plurality of VGAM147 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM147 RNA, herein designated VGAM RNA, and which when bound by VGAM147 RNA causes inhibition of translation of respective one or more VGAM147 host target proteins.

[10790] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM147 gene, herein designated VGAM GENE, on one or more VGAM147 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10791] It is yet further appreciated that a function of VGAM147 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM147 correlate with, and may be deduced from, the identity of the host target genes which VGAM147 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[10792] Nucleotide sequences of the VGAM147 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM147 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM147 are further described hereinbelow with reference to Table 1.

[10793] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM147 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM147 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10794] As mentioned hereinabove with reference to Fig. 1, a function of VGAM147 gene, herein designated VGAM is inhibition of expression of VGAM147 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM147 correlate with, and may be deduced from, the identity of the target genes which VGAM147 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[10795] Lysyl Oxidase-like 2 (LOXL2, Accession NM_002318) is a VGAM147 host target gene. LOXL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOXL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOXL2 BINDING SITE, designated SEQ ID:8133, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:2858.

[10796] A function of VGAM147 is therefore inhibition of Lysyl Oxidase-like 2 (LOXL2, Accession NM_002318), a gene which may have roles in senescence and cell adhesion. Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOXL2. The function of LOXL2 has been established by previous studies. LOXL2 is a member of the lysyl oxidase (LO; 153455) gene family. LO is an extracellular, copper-dependent enzyme that initiates the cross-linking of collagens and elastin by catalyzing the oxidative deamination of peptidyl lysine to alpha-aminoaldehydic-delta-semialdehyde. Members of the LO family have

diverse functions, including tumor suppression and cell adhesion and senescence Saito et al. (1997) used PCR and 5-prime RACE to obtain a full-length cDNA encoding LOXL2. The predicted 774-amino acid LOXL2 protein contains 3 potential N-linked glycosylation sites and 4 scavenger receptor cysteine-rich (SRCR) domains, which are involved in binding to other cell surface or extracellular molecules. LOXL2 also contains residues conserved among copper-binding proteins. In vitro translation produced an 87-kD LOXL2 protein. Northern blot analysis detected a 3.65-kb LOXL2 transcript in adherent tumor cell lines but not in suspension cell lines. Using cultured fibroblasts, Saito et al. (1997) demonstrated that LOXL2 expression is upregulated in senescent fibroblasts, induced by transforming growth factor beta-1 (OMIM Ref. No. 190180) and indomethacin, and inhibited by phorbol ester and retinoic acid. They concluded that LOXL2 is an extracellular matrix component that may be specifically involved in cell adhesion and senescence

[10797] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10798] Saito, H.; Papaconstantinou, J.; Sato, H.; Goldstein, S. :

Regulation of a novel gene encoding a lysyl oxidase-related protein in cellular adhesion and senescence. J. Biol. Chem. 272: 8157-8160, 1997. ; and

[10799] Saito, H.; Papaconstantinou, J.; Sato, H.; Goldstein, S. : Regulation of a novel gene encoding a lysyl oxidase-related protein in cellular adhesion and senescence. J. Biol. Chem. 272: 8157.

[10800] Further studies establishing the function and utilities of LOXL2 are found in John Hopkins OMIM database record ID 606663, and in cited publications numbered 6280-6281, 639 and 6450 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM_035037) is another VGAM147 host target gene. LRP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP4 BINDING SITE, designated SEQ ID:32197, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:2858.

[10801] Another function of VGAM147 is therefore inhibition of Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM_035037). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP4. Solute Carrier Family 22 (organic cation transporter), Member 5 (SLC22A5, Accession NM_003060) is another VGAM147 host target gene. SLC22A5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC22A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A5 BINDING SITE, designated SEQ ID:9026, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:2858.

[10802] Another function of VGAM147 is therefore inhibition of Solute Carrier Family 22 (organic cation transporter), Member 5 (SLC22A5, Accession NM_003060). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A5. KIAA1872 (Accession XM_031917) is another VGAM147 host target gene. KIAA1872 BINDING SITE

is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1872 BINDING SITE, designated SEQ ID:31520, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:2858.

[10803] Another function of VGAM147 is therefore inhibition of KIAA1872 (Accession XM_031917). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1872. MGC3248 (Accession NM_032486) is another VGAM147 host target gene. MGC3248 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3248 BINDING SITE, designated SEQ ID:26238, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:2858.

[10804] Another function of VGAM147 is therefore inhibition of

MGC3248 (Accession NM_032486). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3248. PEPP3 (Accession NM_014935) is another VGAM147 host target gene. PEPP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEPP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEPP3 BINDING SITE, designated SEQ ID:17235, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:2858.

[10805] Another function of VGAM147 is therefore inhibition of PEPP3 (Accession NM_014935). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEPP3. LOC157349 (Accession XM_088298) is another VGAM147 host target gene. LOC157349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157349 BINDING SITE, designated SEQ ID:17236, to the nucleotide sequence of VGAM RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

tarity of the nucleotide sequences of LOC157349 BINDING SITE, designated SEQ ID:39597, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:2858.

[10806] Another function of VGAM147 is therefore inhibition of LOC157349 (Accession XM_088298). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157349. LOC163231 (Accession XM_092094) is another VGAM147 host target gene. LOC163231 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163231 BINDING SITE, designated SEQ ID:40099, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:2858.

[10807] Another function of VGAM147 is therefore inhibition of LOC163231 (Accession XM_092094). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163231. LOC255527 (Accession XM_173026) is an-

other VGAM147 host target gene. LOC255527 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255527 BINDING SITE, designated SEQ ID:46294, to the nucleotide sequence of VGAM147 RNA, herein designated VGAM RNA, also designated SEQ ID:2858.

[10808] Another function of VGAM147 is therefore inhibition of LOC255527 (Accession XM_173026). Accordingly, utilities of VGAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255527. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 148 (VGAM148) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10809] VGAM148 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM148 was detected is described

hereinabove with reference to Figs. 1–8.

[10810] VGAM148 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM148 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10811] VGAM148 gene encodes a VGAM148 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM148 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM148 precursor RNA is designated SEQ ID:134, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:134 is located at position 164623 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10812] VGAM148 precursor RNA folds onto itself, forming VGAM148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10813] An enzyme complex designated DICER COMPLEX, `dices` the VGAM148 folded precursor RNA into VGAM148 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM148 RNA is designated SEQ ID:2859, and is provided hereinbelow with reference to the sequence listing part.

[10814] VGAM148 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM148 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM148 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10815] VGAM148 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM148 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM148 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM148 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM148 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[10816] The complementary binding of VGAM148 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM148 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM148 host target RNA into VGAM148 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10817] It is appreciated that VGAM148 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM148 host target genes. The mRNA of each one of this plurality of VGAM148 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM148 RNA, herein designated VGAM RNA, and which when bound by VGAM148 RNA causes inhibition of translation of respective one or more VGAM148 host target proteins.

[10818] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM148 gene, herein designated VGAM GENE, on one or more VGAM148 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10819] It is yet further appreciated that a function of VGAM148 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM148 correlate with, and may be deduced from, the identity of the host target genes which VGAM148 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10820] Nucleotide sequences of the VGAM148 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM148 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM148 are further described hereinbelow with reference to Table 1.

[10821] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM148 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM148 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10822] As mentioned hereinabove with reference to Fig. 1, a function of VGAM148 gene, herein designated VGAM is inhibition of expression of VGAM148 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM148 correlate with, and may be deduced from, the identity of the target genes which VGAM148 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10823] Caspase 2, Apoptosis-related Cysteine Protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NM_001224) is a VGAM148

host target gene. CASP2 BINDING SITE1 through CASP2 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CASP2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP2 BINDING SITE1 through CASP2 BINDING SITE4, designated SEQ ID:6891, SEQ ID:26854, SEQ ID:26859 and SEQ ID:26864 respectively, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10824] A function of VGAM148 is therefore inhibition of Caspase 2, Apoptosis-related Cysteine Protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NM_001224), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP2. The function of CASP2 has been established by previous studies. Lassus et al. (2002) found that cytotoxic stress causes activation of caspase-2 and that this caspase is required for the permeabilization of mitochondria. Caspase-2 is required for

stress-induced apoptosis and for release of cytochrome c and Smac (OMIM Ref. No. 605219) from mitochondria and for translocation of Bax from the cytoplasm to mitochondria. Animal model experiments lend further support to the function of CASP2. To evaluate the requirement for caspase-2 in various aspects of apoptosis, Bergeron et al. (1998) generated caspase-2-deficient mice. Excess numbers of the germ cells were 'endowed' in ovaries of mutant mice, and the oocytes were resistant to cell death following exposure to chemotherapeutic drugs. Apoptosis mediated by granzyme B (OMIM Ref. No. 123910) and perforin (OMIM Ref. No. 170280) was defective in caspase-2-deficient B lymphoblasts. In contrast, cell death of motor neurons during development was accelerated in caspase-2-deficient mice. In addition, caspase-2-deficient sympathetic neurons underwent apoptosis more effectively than wildtype neurons when deprived of nerve growth factor. Thus, caspase-2 acts as both a positive and a negative cell death effector, depending upon cell lineage and stage of development.

[10825] It is appreciated that the abovementioned animal model for CASP2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[10826] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10827] Bergeron, L.; Perez, G. I.; Macdonald, G.; Shi, L.; Sun, Y.; Jurisicova, A.; Varmuza, S.; Latham, K. E.; Flaws, J. A.; Salter, J. C. M.; Hara, H.; Moskowitz, M. A.; Li, E.; Greenberg, A.; Tilly, J. L.; Yuan, J. : Defects in regulation of apoptosis in caspase-2-deficient mice. *Genes Dev.* 12: 1304-1314, 1998. ; and

[10828] Lassus, P.; Opitz-Araya, X.; Lazebnik, Y. : Requirement for caspase-2 in stress-induced apoptosis before mitochondrial permeabilization. *Science* 297: 1352-1354, 2002.

[10829] Further studies establishing the function and utilities of CASP2 are found in John Hopkins OMIM database record ID 600639, and in sited publications numbered 7129, 7567, 7573-757 and 7126 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Angiomotin (AMOT, Accession NM_133265) is another VGAM148 host target gene. AMOT BINDING SITE1 and AMOT BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AMOT, corresponding to HOST TARGET binding sites such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOT BINDING SITE1 and AMOT BINDING SITE2, designated SEQ ID:28410 and SEQ ID:28418 respectively, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10830] Another function of VGAM148 is therefore inhibition of Angiomotin (AMOT, Accession NM_133265). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOT. Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM_016348) is another VGAM148 host target gene. C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by C5orf4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2, designated SEQ ID:18475 and SEQ ID:15570 respectively, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10831] Another function of VGAM148 is therefore inhibition of Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM_016348). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4. FLJ12985 (Accession NM_024924) is another VGAM148 host target gene. FLJ12985 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12985, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12985 BINDING SITE, designated SEQ ID:24464, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10832] Another function of VGAM148 is therefore inhibition of FLJ12985 (Accession NM_024924). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12985. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640) is another VGAM148 host target gene. GGA2 BINDING SITE1 and GGA2 BINDING SITE2 are HOST TARGET binding sites

found in untranslated regions of mRNA encoded by GGA2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE1 and GGA2 BINDING SITE2, designated SEQ ID:28926 and SEQ ID:17404 respectively, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10833] Another function of VGAM148 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2. KIAA0125 (Accession NM_014792) is another VGAM148 host target gene. KIAA0125 BINDING SITE1 through KIAA0125 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0125, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0125 BINDING SITE1 through KIAA0125 BINDING SITE3, designated SEQ

ID:16691, SEQ ID:30345 and SEQ ID:35403 respectively, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10834] Another function of VGAM148 is therefore inhibition of KIAA0125 (Accession NM_014792). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0125. Paternally Expressed 10 (PEG10, Accession NM_015068) is another VGAM148 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:17434, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10835] Another function of VGAM148 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM_015068). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. PRP8 Pre-mRNA Processing Factor

8 Homolog (yeast) (PRPF8, Accession XM_028335) is another VGAM148 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30677, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10836] Another function of VGAM148 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF8. PRTD-NY3 (Accession NM_030924) is another VGAM148 host target gene. PRTD-NY3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRTD-NY3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRTD-NY3 BINDING SITE, designated SEQ ID:25193, to the nucleotide se-

quence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10837] Another function of VGAM148 is therefore inhibition of PRTD-NY3 (Accession NM_030924). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRTD-NY3. RAI (Accession NM_006663) is another VGAM148 host target gene. RAI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI BINDING SITE, designated SEQ ID:13468, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10838] Another function of VGAM148 is therefore inhibition of RAI (Accession NM_006663). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI. Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869) is another VGAM148 host target gene. SEZ6 BINDING SITE1 and SEZ6 BINDING SITE2 are HOST TARGET

binding sites found in untranslated regions of mRNA encoded by SEZ6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEZ6 BINDING SITE1 and SEZ6 BINDING SITE2, designated SEQ ID:36771 and SEQ ID:36772 respectively, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10839] Another function of VGAM148 is therefore inhibition of Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEZ6. LOC146227 (Accession XM_085374) is another VGAM148 host target gene. LOC146227 BINDING SITE1 through LOC146227 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC146227, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146227 BINDING SITE1 through LOC146227 BINDING SITE4, designated SEQ ID:38084,

SEQ ID:38085, SEQ ID:38086 and SEQ ID:40774 respectively, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10840] Another function of VGAM148 is therefore inhibition of LOC146227 (Accession XM_085374). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146227. LOC150333 (Accession XM_097874) is another VGAM148 host target gene. LOC150333 BINDING SITE1 and LOC150333 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC150333, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150333 BINDING SITE1 and LOC150333 BINDING SITE2, designated SEQ ID:41197 and SEQ ID:41199 respectively, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10841] Another function of VGAM148 is therefore inhibition of LOC150333 (Accession XM_097874). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC150333. LOC153688 (Accession XM_098416) is another VGAM148 host target gene. LOC153688 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:41656, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10842] Another function of VGAM148 is therefore inhibition of LOC153688 (Accession XM_098416). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688. LOC157653 (Accession XM_088353) is another VGAM148 host target gene. LOC157653 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157653, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157653 BINDING SITE, designated SEQ ID:39632, to

the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10843] Another function of VGAM148 is therefore inhibition of LOC157653 (Accession XM_088353). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157653. LOC219404 (Accession XM_167909) is another VGAM148 host target gene. LOC219404 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219404, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219404 BINDING SITE, designated SEQ ID:44910, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10844] Another function of VGAM148 is therefore inhibition of LOC219404 (Accession XM_167909). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219404. LOC221468 (Accession NM_145316) is another VGAM148 host target gene. LOC221468 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC221468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221468 BINDING SITE, designated SEQ ID:29827, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10845] Another function of VGAM148 is therefore inhibition of LOC221468 (Accession NM_145316). Accordingly, utilities of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221468. LOC255624 (Accession XM_170531) is another VGAM148 host target gene. LOC255624 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255624 BINDING SITE, designated SEQ ID:45352, to the nucleotide sequence of VGAM148 RNA, herein designated VGAM RNA, also designated SEQ ID:2859.

[10846] Another function of VGAM148 is therefore inhibition of LOC255624 (Accession XM_170531). Accordingly, utilities

of VGAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255624. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 149 (VGAM149) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10847] VGAM149 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM149 was detected is described hereinabove with reference to Figs. 1–8.

[10848] VGAM149 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM149 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10849] VGAM149 gene encodes a VGAM149 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM149 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM149 precursor RNA is designated SEQ ID:135, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:135 is located at position 68772 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10850] VGAM149 precursor RNA folds onto itself, forming VGAM149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10851] An enzyme complex designated DICER COMPLEX, `dices` the VGAM149 folded precursor RNA into VGAM149 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide se-

quence of VGAM149 RNA is designated SEQ ID:2860, and is provided hereinbelow with reference to the sequence listing part.

[10852] VGAM149 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM149 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM149 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[10853] VGAM149 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM149 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM149 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM149 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM149 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[10854] The complementary binding of VGAM149 RNA, herein designated VGAM RNA, to host target binding sites on VGAM149 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM149 host target RNA into VGAM149 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10855] It is appreciated that VGAM149 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM149 host target genes. The mRNA of each one of this plurality of VGAM149 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM149 RNA, herein designated VGAM RNA, and which when bound by VGAM149 RNA causes inhibition of translation of respective one or more VGAM149 host target proteins.

[10856] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM149 gene, herein designated VGAM GENE, on one or more VGAM149 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10857] It is yet further appreciated that a function of VGAM149 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM149 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM149 correlate with, and may be deduced from, the identity of the host target genes which VGAM149 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10858] Nucleotide sequences of the VGAM149 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM149 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM149 are further described hereinbelow with reference to Table 1.

[10859] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM149 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM149 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[10860] As mentioned hereinabove with reference to Fig. 1, a function of VGAM149 gene, herein designated VGAM is inhibition of expression of VGAM149 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM149 correlate with, and may be deduced from, the identity of the target genes which VGAM149 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10861] Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM_101395) is a VGAM149 host target gene. DYRK1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DYRK1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK1A BINDING SITE, designated SEQ ID:28159, to the nucleotide sequence of VGAM149 RNA, herein designated VGAM RNA, also designated SEQ ID:2860.

[10862] A function of VGAM149 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM_101395), a gene which regu-

lates cell proliferation and may be involved in brain development . Accordingly, utilities of VGAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK1A. The function of DYRK1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42. Glucosaminyl (N-acetyl) Transferase 1, Core 2 (beta-1,6-N-acetylglucosaminyltransferase) (GCNT1, Accession NM_001490) is another VGAM149 host target gene. GCNT1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GCNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCNT1 BINDING SITE, designated SEQ ID:7237, to the nucleotide sequence of VGAM149 RNA, herein designated VGAM RNA, also designated SEQ ID:2860.

[10863] Another function of VGAM149 is therefore inhibition of Glucosaminyl (N-acetyl) Transferase 1, Core 2 (beta-1,6-N-acetylglucosaminyltransferase) (GCNT1, Accession NM_001490), a gene which forms critical

branches in o-glycans. Accordingly, utilities of VGAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCNT1. The function of GCNT1 has been established by previous studies. Bierhuizen et al. (1993) provided the sequence of the developmental I antigen encoded by the cDNA for a member of a beta-1,6-N-acetylglucosaminyltransferase gene family. By Northern blot analysis, Yeh et al. (1999) showed that multiple transcripts of GCNT1 were expressed in nearly all tissues tested, whereas expression of GCNT3 (OMIM Ref. No. 606836) was more restricted. Transcripts were also readily detected in some leukemic cell lines and in colon and cervical carcinoma cell lines, but not in a lung carcinoma cell line.

[10864] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10866] Pilz, A.; Woodward, K.; Povey, S.; Abbott, C. : Comparative

mapping of 50 human chromosome 9 loci in the laboratory mouse. Genomics 25: 139–149, 1995.

[10867] Further studies establishing the function and utilities of GCNT1 are found in John Hopkins OMIM database record ID 600391, and in cited publications numbered 1215 and 12157 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM_003678) is another VGAM149 host target gene. C22orf19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C22orf19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf19 BINDING SITE, designated SEQ ID:9772, to the nucleotide sequence of VGAM149 RNA, herein designated VGAM RNA, also designated SEQ ID:2860.

[10868] Another function of VGAM149 is therefore inhibition of Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM_003678). Accordingly, utilities of VGAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf19.

FLJ32332 (Accession NM_144641) is another VGAM149 host target gene. FLJ32332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32332 BINDING SITE, designated SEQ ID:29466, to the nucleotide sequence of VGAM149 RNA, herein designated VGAM RNA, also designated SEQ ID:2860.

[10869] Another function of VGAM149 is therefore inhibition of FLJ32332 (Accession NM_144641). Accordingly, utilities of VGAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32332. FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM_054016) is another VGAM149 host target gene. FUSIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUSIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUSIP1 BINDING SITE, designated SEQ ID:27622, to the nucleotide sequence of VGAM149 RNA,

herein designated VGAM RNA, also designated SEQ ID:2860.

[10870] Another function of VGAM149 is therefore inhibition of FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM_054016). Accordingly, utilities of VGAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUSIP1. ORM1-like 2 (*S. cerevisiae*) (ORMDL2, Accession NM_014182) is another VGAM149 host target gene. ORMDL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ORMDL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ORMDL2 BINDING SITE, designated SEQ ID:15465, to the nucleotide sequence of VGAM149 RNA, herein designated VGAM RNA, also designated SEQ ID:2860.

[10871] Another function of VGAM149 is therefore inhibition of ORM1-like 2 (*S. cerevisiae*) (ORMDL2, Accession NM_014182). Accordingly, utilities of VGAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ORMDL2. RAI (Accession NM_006663) is another VGAM149 host target gene. RAI

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI BINDING SITE, designated SEQ ID:13466, to the nucleotide sequence of VGAM149 RNA, herein designated VGAM RNA, also designated SEQ ID:2860.

[10872] Another function of VGAM149 is therefore inhibition of RAI (Accession NM_006663). Accordingly, utilities of VGAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 150 (VGAM150) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10873] VGAM150 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM150 was detected is described hereinabove with reference to Figs. 1–8.

[10874] VGAM150 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM150 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10875] VGAM150 gene encodes a VGAM150 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM150 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM150 precursor RNA is designated SEQ ID:136, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:136 is located at position 59190 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10876] VGAM150 precursor RNA folds onto itself, forming VGAM150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[10877] An enzyme complex designated DICER COMPLEX, `dices` the VGAM150 folded precursor RNA into VGAM150 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM150 RNA is designated SEQ ID:2861, and is provided hereinbelow with reference to the sequence listing part.

[10878] VGAM150 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM150 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM150 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10879] VGAM150 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM150 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM150 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM150 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM150 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10880] The complementary binding of VGAM150 RNA, herein designated VGAM RNA, to host target binding sites on VGAM150 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM150 host target RNA into VGAM150 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10881] It is appreciated that VGAM150 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM150 host target genes. The mRNA of each one of this plurality of VGAM150 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM150 RNA, herein designated VGAM RNA, and which when bound by VGAM150 RNA causes inhibition of translation of respective one or more VGAM150 host target proteins.

[10882] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM150 gene, herein designated VGAM GENE, on one or more VGAM150 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10883] It is yet further appreciated that a function of VGAM150 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM150 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM150 correlate with, and may be deduced from, the identity of the host target genes which VGAM150 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10884] Nucleotide sequences of the VGAM150 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM150 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM150 are further described hereinbelow with reference to Table 1.

[10885] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM150 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM150 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10886] As mentioned hereinabove with reference to Fig. 1, a function of VGAM150 gene, herein designated VGAM is inhibition of expression of VGAM150 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM150 correlate with, and may be deduced from, the identity of the target genes which VGAM150 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10887] PRO1489 (Accession NM_018584) is a VGAM150 host target gene. PRO1489 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1489 BINDING SITE, designated SEQ ID:20661, to the nucleotide sequence of VGAM150 RNA, herein designated VGAM RNA, also designated SEQ ID:2861.

[10888] A function of VGAM150 is therefore inhibition of PRO1489 (Accession NM_018584). Accordingly, utilities of VGAM150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1489. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 151 (VGAM151) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10889] VGAM151 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM151 was detected is described hereinabove with reference to Figs. 1–8.

[10890] VGAM151 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM151 host target gene, herein designated VGAM HOST TARGET GENE,

is a human gene contained in the human genome.

[10891] VGAM151 gene encodes a VGAM151 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM151 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM151 precursor RNA is designated SEQ ID:137, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:137 is located at position 141707 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10892] VGAM151 precursor RNA folds onto itself, forming VGAM151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10893] An enzyme complex designated DICER COMPLEX, `dices` the VGAM151 folded precursor RNA into VGAM151 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM151 RNA is designated SEQ ID:2862, and is provided hereinbelow with reference to the sequence listing part.

[10894] VGAM151 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM151 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM151 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10895] VGAM151 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM151 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM151 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM151 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM151 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10896] The complementary binding of VGAM151 RNA, herein designated VGAM RNA, to host target binding sites on VGAM151 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM151 host target RNA into VGAM151 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[10897] It is appreciated that VGAM151 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM151 host target genes. The mRNA of each one of this plurality of VGAM151 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM151 RNA, herein designated VGAM RNA, and which when bound by VGAM151 RNA causes inhibition of translation of respective one or more VGAM151 host target proteins.

[10898] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM151 gene, herein designated VGAM GENE, on one or more VGAM151 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10899] It is yet further appreciated that a function of VGAM151 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM151 correlate with, and may be deduced from, the identity of the host target genes which VGAM151 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10900] Nucleotide sequences of the VGAM151 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM151 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM151 are further described hereinbelow with reference to Table 1.

[10901] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM151 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM151 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10902] As mentioned hereinabove with reference to Fig. 1, a function of VGAM151 gene, herein designated VGAM is inhibition of expression of VGAM151 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM151 correlate with, and may be deduced from, the identity of the target genes which VGAM151 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10903] PACE (Accession NM_002569) is a VGAM151 host target gene. PACE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PACE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACE BINDING SITE, designated SEQ ID:8424, to the nucleotide sequence of VGAM151 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:2862.

[10904] A function of VGAM151 is therefore inhibition of PACE (Accession NM_002569), a gene which processes pro-parathyroid hormone, pro-transforming growth factor beta. Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE. The function of PACE has been established by previous studies. Roebroek et al. (1986) described DNA sequences in the immediate upstream region from the FES oncogene (OMIM Ref. No. 190030). They designated this FUR (for FES upstream region) and showed that in both man and cat the sequence codes for a 4.5-kb mRNA. The nucleotide sequence of a 3.1-kb FUR-specific cDNA isolated from a human cDNA library showed an open reading frame of 1,498 bp from which the 499 carboxy-terminal amino acids of the primary FUR translation product could be deduced. Computer analysis indicated that this product, called furin, contained a possible transmembrane domain resembling that of class II MHC antigens. Roebroek et al. (1986) concluded that FUR may encode a membrane-associated protein with a recognition function. From the location of the FES gene, one can conclude that FUR is located in the region 15q25-q26. The 2

sequences are separated by less than 1.1 kb, and the direction of transcription of the 2 is the same. Studying its expression by Northern blot analysis using poly(A)-selected RNA from a variety of organs, Schalken et al. (1987) found that the FUR gene is differentially expressed, being high in organs such as liver and kidney and very low in others such as heart muscle, lung, and testis. FUR expression discriminated sharply between small cell lung cancers, which had no expression, and nonsmall cell lung cancers, which had strong elevation of expression. Hendy et al. (1995) reported experiments strongly suggesting that furin is the enzyme responsible for the physiologic processing of parathyroid hormone to PTH (OMIM Ref. No. 168450). Dubois et al. (1995) demonstrated in vitro that pro-TGFB1 (see OMIM Ref. No. 190180) was cleaved by furin to produce a biologically active TGFB1 protein. Expression of pro-TGFB1 in furin-deficient cells produced no TGFB1, while coexpression of pro-TGFB1 and furin led to processing of the precursor. Blanchette et al. (1997) showed that furin mRNA levels were increased in rat synovial cells by the addition of TGFB1. This effect was eliminated by pretreatment with actinomycin-D, suggesting to them that regulation was at

the gene transcriptional level. Treatment of rat synovio-
cytes and kidney fibroblasts with TGFB1 or TGFB2 resulted
in increased pro-TGFB1 processing, as evidenced by the
appearance of a 40-kD immunoreactive band correspond-
ing to the TGFB1 amino-terminal pro-region. Treatment
of these cells with TGFB2 resulted in a significant increase
in extracellular mature TGFB1. Blanchette et al. (1997)
concluded that TGFB1 upregulates gene expression of its
own converting enzyme.

converting enzyme furin. J. Clin. Invest. 99: 1974-1983,
1997.
- [10908] Further studies establishing the function and utilities of
PACE are found in John Hopkins OMIM database record ID

136950, and in cited publications numbered 3576–3583 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ13241

(Accession NM_025088) is another VGAM151 host target gene. FLJ13241 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13241 BINDING SITE, designated SEQ ID:24707, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:2862.

[10909] Another function of VGAM151 is therefore inhibition of FLJ13241 (Accession NM_025088). Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13241. KIAA0546 (Accession XM_049055) is another VGAM151 host target gene. KIAA0546 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0546 BINDING SITE, designated SEQ ID:35331, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:2862.

[10910] Another function of VGAM151 is therefore inhibition of KIAA0546 (Accession XM_049055). Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0546. KIAA1449 (Accession NM_020839) is another VGAM151 host target gene. KIAA1449 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1449 BINDING SITE, designated SEQ ID:21898, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:2862.

[10911] Another function of VGAM151 is therefore inhibition of KIAA1449 (Accession NM_020839). Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1449. LOC113523 (Accession XM_054378) is another

VGAM151 host target gene. LOC113523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC113523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113523 BINDING SITE, designated SEQ ID:36151, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:2862.

[10912] Another function of VGAM151 is therefore inhibition of LOC113523 (Accession XM_054378). Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113523. LOC133584 (Accession XM_059661) is another VGAM151 host target gene. LOC133584 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC133584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133584 BINDING SITE, designated SEQ ID:37045, to the nucleotide sequence of VGAM151 RNA, herein designated VGAM RNA, also designated SEQ ID:2862.

[10913] Another function of VGAM151 is therefore inhibition of LOC133584 (Accession XM_059661). Accordingly, utilities of VGAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133584. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 152 (VGAM152) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10914] VGAM152 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM152 was detected is described hereinabove with reference to Figs. 1–8.

[10915] VGAM152 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM152 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10916] VGAM152 gene encodes a VGAM152 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM152

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM152 precursor RNA is designated SEQ ID:138, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:138 is located at position 36222 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10917] VGAM152 precursor RNA folds onto itself, forming VGAM152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10918] An enzyme complex designated DICER COMPLEX, `dices` the VGAM152 folded precursor RNA into VGAM152 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM152 RNA is designated SEQ ID:2863, and is provided hereinbelow with reference to the sequence listing part.

[10919] VGAM152 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM152 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM152 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10920] VGAM152 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM152 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM152 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM152 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM152 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[10921] The complementary binding of VGAM152 RNA, herein designated VGAM RNA, to host target binding sites on VGAM152 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM152 host target RNA into VGAM152 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10922] It is appreciated that VGAM152 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM152 host target genes. The mRNA of

each one of this plurality of VGAM152 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM152 RNA, herein designated VGAM RNA, and which when bound by VGAM152 RNA causes inhibition of translation of respective one or more VGAM152 host target proteins.

[10923] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM152 gene, herein designated VGAM GENE, on one or more VGAM152 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[10924] It is yet further appreciated that a function of VGAM152 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM152 correlate with, and may be deduced from, the identity of the host target genes which VGAM152 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10925] Nucleotide sequences of the VGAM152 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM152 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM152 are further described hereinbelow with reference to Table 1.

[10926] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM152 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM152 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10927] As mentioned hereinabove with reference to Fig. 1, a function of VGAM152 gene, herein designated VGAM is inhibition of expression of VGAM152 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM152 correlate with, and may be deduced from, the identity of the target genes which VGAM152 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10928] Apical Protein-like (*Xenopus laevis*) (APXL, Accession NM_001649) is a VGAM152 host target gene. APXL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APXL BINDING SITE, designated SEQ ID:7354, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10929] A function of VGAM152 is therefore inhibition of Apical Protein-like (*Xenopus laevis*) (APXL, Accession

NM_001649), a gene which is implicated in amiloride-sensitive sodium channel activity. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APXL. The function of APXL has been established by previous studies. APXL is a human homolog of the *Xenopus laevis* APX gene which is implicated in amiloride-sensitive sodium channel activity (Schiaffino et al., 1995). The gene contains 10 exons and spans approximately 160 kb of Xp22.3 in the ocular albinism type 1 (OA1; 300500) critical region. The full-length mRNA is approximately 7.5 kb, and Schiaffino et al. (1995) isolated several clones from a retinal cDNA library that corresponded to this mRNA. The authors found that, along with retina, the gene is expressed in melanoma cells, brain, placenta, lung, kidney, and pancreas. The protein is 1,616 amino acids in length. APXL was deleted in 2 patients with contiguous gene syndromes including OA1 and in 1 patient with isolated OA1. Comparative mapping of the X chromosome in eutherian mammals has revealed distinct regions of conservation as well as evolutionary rearrangements between human and mouse. Dinulos et al. (1996) mapped the murine homologs of OA1 and APXL. They found that the 2 genes

map to bands F2–F3 in both *M. spretus* and the laboratory strains C57BL/6J, defining a new rearrangement between human and mouse X chromosomes.

[10930] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10931] Dinulos, M. B.; Bassi, M. T.; Rugarli, E. I.; Chapman, V.; Ballabio, A.; Disteche, C. M. : A new region of conservation is defined between human and mouse X chromosomes. *Genomics* 35: 244–247, 1996. ; and

[10932] Schiaffino, M. V.; Bassi, M. T.; Rugarli, E. I.; Renieri, A.; Galli, L.; Ballabio, A. : Cloning of a human homologue of the *Xenopus laevis* APX gene from the ocular albinism type 1 criti.

[10933] Further studies establishing the function and utilities of APXL are found in John Hopkins OMIM database record ID 300103, and in cited publications numbered 8797–8798 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATPase, Na⁺/K⁺ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678) is another VGAM152 host target gene. ATP1B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

ATP1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B2 BINDING SITE, designated SEQ ID:7392, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10934] Another function of VGAM152 is therefore inhibition of ATPase, Na⁺/K⁺ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678), a gene which catalyzes the hydrolysis of ATP coupled with the exchange of Na⁺/K⁺ ions across the plasma membrane. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B2. The function of ATP1B2 has been established by previous studies. In the mouse, Malo et al. (1990) mapped the beta-2 subunit of sodium-potassium-ATPase to chromosome 11 in a segment that is conserved on the pericentromeric region of human chromosome 17. Thus, Malo et al. (1990) speculated that the human ATP1B2 gene is on the proximal short arm or pericentric area of chromosome 17. By somatic cell hybrid analysis, Hsieh et al. (1990) demonstrated that the gene is

indeed located on human chromosome 17 and confirmed the assignment to mouse chromosome 11, They referred to the gene as AMOG (adhesion molecule on glia). The adhesion molecule on glia is an integral membrane glycoprotein of MW 45–50 K that is expressed by glial cells and mediates granule neuron migration along Bergmann glial cells in the developing cerebellum. The cDNA sequence of the mouse gene (Pagliusi et al., 1989) shows structural similarity to the beta subunit of Na,K-ATPase (ATP1B1; 182330). This enzyme consists of 2 subunits: a catalytic alpha subunit and a beta subunit of unknown function. Like ATP1B1, AMOG is molecularly associated with the alpha subunit and influences its catalytic activity. AMOG may be the same as what is referred to here as ATP1B2. Another beta-isoform gene expressed primarily in brain was isolated by Martin-Vasallo et al. (1989); its sequence is 97% identical to that for AMOG (Gloor et al., 1990). By study of recombinant inbred strains, Hsieh et al. (1990) placed the Amog locus close to the genes for zinc finger protein-3 (OMIM Ref. No. 194480) and the asialoglycoprotein receptor (108360, 108361) in a region of mouse chromosome 11 that is homologous to human 17p.

[10935] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [10936] Gloor, S.; Antonicek, H.; Sweadner, K. J.; Pagliusi, S.; Frank, R.; Moos, M.; Schachner, M. : The adhesion molecule on glia (AMOG) is a homologue of the beta subunit of the Na,K-ATPase. J. Cell Biol. 110: 165-174, 1990. ; and
- [10937] Martin-Vasallo, P.; Dackowski, P.; Emanuel, J. R.; Levenson, R. : Identification of a putative isoform of the Na,K-ATPase beta subunit: primary structure and tissue-specific expression.
- [10938] Further studies establishing the function and utilities of ATP1B2 are found in John Hopkins OMIM database record ID 182331, and in cited publications numbered 12450-12454 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM_005093) is another VGAM152 host target gene. CBFA2T2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:11548, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10939] Another function of VGAM152 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM_005093), a gene which is a putative transcription factor. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2. The function of CBFA2T2 has been established by previous studies. To identify potential new genes homologous to ETO (OMIM Ref. No. 133435), Fracchiolla et al. (1998) screened the EST database using the entire ETO cDNA sequence as a probe. Among the ESTs identified, they selected 2 overlapping clones and sequenced them to completion. A putative translation initiation site was identified by the presence of a strong Kozak consensus sequence, followed by a 1,725-bp open reading frame coding for a putative protein of 575 amino acids. They named this gene EHT for 'ETO homolog on chromosome twenty.' The putative EHT protein is approximately 65% identical to ETO/MTG8 (OMIM Ref. No. 133435) and ap-

proximately 24% identical to an ETO *Drosophila* homolog, Nervy. Kitabayashi et al. (1998) reported the cloning of a similar cDNA, which they named MTGR1 (myeloid translocation gene-related protein-1). Their data suggested the presence of 2 alternative 5-prime ends of the MTGR1/EHT gene. Cytogenetic studies had shown that the 20q11 region is deleted in approximately 10% of cases of polycythemia vera, approximately 5% of cases of myelodysplastic syndromes, and approximately 3% of cases of acute myeloid leukemias. Kitabayashi et al. (1998) showed the direct interaction of MTGR1 in the AML1-MTG8 fusion protein, leading to an enhancement of cell proliferation mediated by granulocyte colony-stimulating factor (CSF3; 138970) in a murine myeloid model. This suggested that MTGR1 has an oncogenic rather than a tumor suppressor activity. Nevertheless, when MTGR1 was transfected alone into the same murine myeloid model cell line, the proliferative response to CSF was lower than that in the normal control, thus suggesting a possible negative growth control in normal cells.

[10940] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [10941] Fracchiolla, N. S.; Colombo, G.; Finelli, P.; Maiolo, A. T.; Neri, A. : EHT, a new member of the MTG8/ETO gene family, maps on 20q11 region and is deleted in acute myeloid leukemias. (Letter) Blood 92: 3481–3484, 1998. ; and
- [10942] Kitabayashi, I.; Ida, K.; Morohoshi, F.; Yokoyama, A.; Mitsuhashi, N.; Shimizu, K.; Nomura, N.; Hayashi, Y.; Ohki, M. : The AML1–MTG8 leukemic fusion protein forms a complex with a novel.
- [10943] Further studies establishing the function and utilities of CBFA2T2 are found in John Hopkins OMIM database record ID 603672, and in cited publications numbered 344 and 8659–8660 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cartilage Associated Protein (CRTAP, Accession NM_006371) is another VGAM152 host target gene. CRTAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRTAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRTAP BINDING SITE, designated SEQ ID:13061, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ

ID:2863.

[10944] Another function of VGAM152 is therefore inhibition of Cartilage Associated Protein (CRTAP, Accession NM_006371), a gene which is a novel developmentally regulated chick embryo protein. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAP. The function of CRTAP has been established by previous studies. Castagnola et al. (1997) isolated a mouse *Crtap* cDNA from a subtracted library specific for mRNAs highly expressed in hypertrophic chondrocytes compared to proliferating and early differentiating chondrocytes. Using a mouse *Crtap* clone to screen a human fetal brain cDNA library, Tonachini et al. (1999) identified human CRTAP cDNA clones. Human CRTAP encodes a deduced 401-amino acid protein with a putative signal peptide of 26 amino acids. CRTAP contains 2 potential N-glycosylation signals. CRTAP shares 89% amino acid sequence identity with mouse *Crtap* and 51% identity with the chick homolog. The mouse and human genes contain a C-terminal region of approximately 120 amino acids not present in the chick protein. Using Northern blot analysis of human tissues, Tonachini et al. (1999) detected 2-kb

and 4-kb CRTAP transcripts in brain, heart, kidney, lung, small intestine, and skeletal muscle. In all tissues except brain, the 2-kb transcript was more abundant. Using immunohistochemistry, the authors detected CRTAP expression in articular chondrocytes. In mouse, Morello et al. (1999) detected 3 *Crtap* transcripts in a range of tissues, including all mouse embryonic cartilages. In chick, Castagnola et al. (1997) detected a single *Crtap* transcript in a broad range of embryonic tissues with the strongest expression in the developing cartilage. They detected expression in the extracellular matrix of the forming cartilage surrounding the notochord, the developing sclera, the sphenoid and mandibular cartilage, the long bone cartilage, and the developing sternal cartilage

[10945] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10946] Castagnola, P.; Gennari, M.; Morello, R.; Tonachini, L.; Marin, O.; Gaggero, A.; Cancedda, R. : Cartilage associated protein (CASP) is a novel developmentally regulated chick embryo protein. *J. Cell Sci.* 110: 1351–1359, 1997. ; and

[10947] Morello, R.; Tonachini, L.; Monticone, M.; Viggiano, L.; Rocchi, M.; Cancedda, R.; Castagnola, P. : cDNA cloning,

characterization and chromosome mapping of Crtap encoding the mouse carti.

[10948] Further studies establishing the function and utilities of CRTAP are found in John Hopkins OMIM database record ID 605497, and in cited publications numbered 6396–6398 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199) is another VGAM152 host target gene. EIF2C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2C1 BINDING SITE, designated SEQ ID:14499, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10949] Another function of VGAM152 is therefore inhibition of Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199), a gene which plays an important role in the eukaryotic peptide chain initiation process. Accordingly, utilities of VGAM152 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with EIF2C1. The function of EIF2C1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM118. Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 3 (GNB3, Accession NM_002075) is another VGAM152 host target gene. GNB3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GNB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNB3 BINDING SITE, designated SEQ ID:7853, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10950] Another function of VGAM152 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 3 (GNB3, Accession NM_002075), a gene which transduces signals from G protein-coupled receptors to intracellular effectors. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB3. The function of GNB3 has been established by previous stud-

ies. Levine et al. (1990) cloned a third form of the G protein beta-subunit polypeptide distinct from the 36-kD form (GNB1; 139380) and the 35-kD form (GNB2; 139390). The GNB3 cDNA corresponded to a 2.0-kb mRNA expressed in all tissues and clonal cell lines examined. The encoded peptide consisted of 340 amino acid residues. Modi et al. (1989) mapped the GNB3 gene to 12p13 by use of somatic cell hybrids and in situ hybridization. Levine et al. (1990) mapped the gene to 12pter-p12.3 by Southern analysis of somatic cell hybrids and by in situ hybridization. Siffert et al. (1995) and Pietruck et al. (1996) demonstrated an enhanced signal transduction via pertussis toxin-sensitive G proteins in lymphoblasts and fibroblasts from selected patients with essential hypertension. They speculated that structural changes in the alpha, beta, or gamma subunit of heterotrimeric G proteins could be responsible for the enhanced G-protein reactivity in hypertensive cells. In studies of the GNB3 gene, they demonstrated an 825C-T polymorphism. Although the polymorphism did not affect the amino acid sequence of the beta-3 subunit, the T allele was associated with deletion of nucleotides 498-620 of exon 9 (139130.0001). This was found to be an example

of alternative splicing caused by a nucleotide change outside the splice donor and acceptor sites. Other examples include the alternative splicing of the platelet membrane glycoprotein IIIa, as reported by Jin et al. (1996), in Glanzmann thrombasthenia (OMIM Ref. No. 273800), in the human growth hormone receptor (OMIM Ref. No. 600946) by Stallings-Mann et al. (1996), and in the fibrillin-1 gene (OMIM Ref. No. 134797) in Marfan syndrome by Liu et al. (1997).

[10951] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10952] Levine, M. A.; Modi, W. S.; O'Brien, S. J. : Chromosomal localization of the genes encoding two forms of the G-protein beta polypeptide, beta-1 and beta-3, in man. *Genomics* 8: 380-386, 1990. ; and

[10953] Siffert, W.; Roszkopf, D.; Moritz, A.; Wieland, T.; Kaldenberg-Stasch, S.; Kettler, N.; Hartung, K.; Beckmann, S.; Jakobs, K. H. : Enhanced G protein activation in immortalized lymphobl.

[10954] Further studies establishing the function and utilities of GNB3 are found in John Hopkins OMIM database record ID 139130, and in cited publications numbered 471 and

4715–4727 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 5–hydroxytryptamine (serotonin) Receptor 1D (HTR1D, Accession NM_000864) is another VGAM152 host target gene. HTR1D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTR1D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR1D BINDING SITE, designated SEQ ID:6529, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10955] Another function of VGAM152 is therefore inhibition of 5–hydroxytryptamine (serotonin) Receptor 1D (HTR1D, Accession NM_000864), a gene which belongs to G-protein coupled receptor. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR1D. The function of HTR1D has been established by previous studies. The serotonin 1D receptor was initially characterized by radioligand binding procedures using membranes derived from bovine caudate nucleus. The 5-HT-1D re-

ceptor is known to be a G protein–coupled receptor. Sumatriptan, an agent effective in the treatment of acute migraine, is the only ligand yet identified that is selective for the 5–HT–1D receptor. Weinshank et al. (1992) reported the cloning, deduced amino acid sequences, pharmacologic properties, and second–messenger coupling of a pair of human 5–HT–1D receptor genes, which they designated alpha and beta due to their strong similarities. Both genes have no introns in their coding regions, are expressed in the human cerebral cortex, and can couple to inhibition of adenylate cyclase activity. Their pharmacologic binding properties match closely those of human, bovine, and guinea pig 5–HT–1D sites. Libert et al. (1991) obtained cDNA clones encoding 4 receptors of the G protein–coupled receptor family by selective amplification and cloning from thyroid cDNA. One of these clones, termed RDC4 by them, showed close structural similarity with the serotonin 5HT1A receptor (OMIM Ref. No. 109760). By in situ hybridization, they demonstrated that the gene (HTR1D) is located on chromosome 1 at 1p36.3–p34.3. By Southern blot analysis of a hybrid cell panel, Jin et al. (1992) showed that the HTR1D gene is located on chromosome 1. Wilkie et al. (1993) showed that

the homologous gene in the mouse is located on chromosome 4.

[10956] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10957] Weinshank, R. L.; Zgombick, J. M.; Macchi, M. J.; Branchek, T. A.; Hartig, P. R. : Human serotonin 1D receptor is encoded by a subfamily of two distinct genes: 5-HT(1D-alpha) and 5-HT(1D-beta). Proc. Nat. Acad. Sci. 89: 3630-3634, 1992. ; and

[10958] Wilkie, T. M.; Chen, Y.; Gilbert, D. J.; Moore, K. J.; Yu, L.; Simon, M. I.; Copeland, N. G.; Jenkins, N. A. : Identification, chromosomal location, and genome organization of mammalian.

[10959] Further studies establishing the function and utilities of HTR1D are found in John Hopkins OMIM database record ID 182133, and in cited publications numbered 10613, 1061 and 11892 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Insulin-like Growth Factor 1 Receptor (IGF1R, Accession NM_000875) is another VGAM152 host target gene. IGF1R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IGF1R,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGF1R BINDING SITE, designated SEQ ID:6556, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10960] Another function of VGAM152 is therefore inhibition of Insulin-like Growth Factor 1 Receptor (IGF1R, Accession NM_000875), a gene which binds insulin-like growth factors and has a tyrosine-protein kinase activity. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF1R. The function of IGF1R has been established by previous studies. Flier et al. (1986) studied a monoclonal antibody to the receptor for type I insulin-like growth factor (IGF1; 147440). This might be the site of the change in some forms of growth disturbance. Ullrich et al. (1986) determined the complete primary structure of the receptor for IGF I from cloned cDNA. The deduced sequence predicts a 1,367-amino acid receptor precursor, including a 30-residue signal peptide, which is removed during translocation of the nascent polypeptide chain. Cleavage of the precursor generates alpha and beta sub-

units as in the case of the insulin receptor (INSR; 147670). Abbott et al. (1992) determined that the IGF1R gene contains 21 exons and spans about 100 kb. Cooke et al. (1991) analyzed the promoter region and found that the 5-prime flanking and untranslated region is GC-rich and contains numerous potential SP1 and AP2 binding sites as well as a thyroid response element, but no TATA or CCAAT elements. Prager et al. (1992) showed that a mutant human IGF-I receptor interfered with the expected suppression of growth hormone in cultured rat pituitary cells, thus demonstrating a dominant-negative phenotype. (The 'dominant-negative' concept was first clearly articulated by Herskowitz (1987). He recognized 2 classes. The first class comprises multimeric proteins dependent on oligomerization for activity; the presence in a multimer of a mutant subunit with intact binding but altered catalytic domains can abrogate the function of the entire multimer. The second class involves monomeric proteins, in which dominant-negative mutations can occur if substrate is limiting; a mutant able to bind the substrate but not metabolize it would have this effect.) Using a yeast 2-hybrid system, Dey et al. (1998) identified a regulatory subunit of phosphatidylinositol (PI) 3-kinase, PIK3R3

(OMIM Ref. No. 606076), as a binding partner of IGF1R. They concluded that the SH2 domain of PIK3R3 interacts with IGF1R and INSR in a kinase-dependent manner, providing an alternative pathway for the activation of PI 3-kinase by these 2 receptors. Rotem-Yehudar et al. (2001) found evidence that IGF1R associated with SNAP29 (OMIM Ref. No. 604202), a synaptosomal-associated protein, and with EHD1 (OMIM Ref. No. 605888), a protein containing motifs important for protein-protein interaction and for intracellular sorting. Through immunoprecipitation of rat tissues, they found that SNAP29 and EHD1 are present in complexes with IGF1R. They also found that IGF1 induction of EHD1-transfected CHO cells results in intracellular colocalization of EHD1 and IGF1R. Animal model experiments lend further support to the function of IGF1R. Fernandez et al. (2001) developed transgenic mice overexpressing a dominant-negative IGF1R, containing a mutation that abolishes ATPase activity, specifically targeted to skeletal muscle. They found that mutant IGF1R impairs the function of both the normal endogenous IGF1R and the insulin receptor, and that mice overexpressing the mutant IGF1R developed insulin resistance and pancreatic beta-cell dysfunction followed by diabetes.

By coimmunoprecipitation experiments, Fernandez et al. (2001) showed interaction between mutant and normal IGF1R hemireceptors as well as between mutant IGF1R and INSR, suggesting the formation of nonfunctional hybrid receptors. Through biochemical analysis, they showed that the mutant hemireceptor fails to autophosphorylate and thereby abrogates the normal function of the hybrid receptors. To identify genetic determinants of hypoxic cell death, Scott et al. (2002) screened for hypoxia-resistant mutants in *C. elegans* and found that specific reduction-of-function mutants of *daf2*, an insulin/insulin-like growth factor receptor homolog gene, were profoundly hypoxia resistant. The hypoxia resistance was acutely inducible just before hypoxic exposure and was mediated through the AKT1/PDK1/forkhead transcription factor pathway overlapping with but distinct from signaling pathways regulating lifespan and stress resistance. Selective neuronal and muscle expression of *daf2* wildtype restored hypoxic death, and *daf2* reduction of function mutants prevented hypoxia-induced muscle and neuronal cell death, demonstrating a potential for insulin/insulin-like growth factor receptor modulation in prophylaxis against hypoxic injury of neurons and myocytes.

- [10961] It is appreciated that the abovementioned animal model for IGF1R is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.
- [10962] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [10965] Further studies establishing the function and utilities of IGF1R are found in John Hopkins OMIM database record ID 147370, and in cited publications numbered 11275-11286, 5228, 11287-11288, 11235, 1128 and 11323-11327 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Intermediate/small Conductance Calcium-

activated Channel, Subfamily N, Member 4 (KCNN4, Accession NM_002250) is another VGAM152 host target gene. KCNN4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNN4 BINDING SITE, designated SEQ ID:8036, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10966] Another function of VGAM152 is therefore inhibition of Potassium Intermediate/small Conductance Calcium-activated Channel, Subfamily N, Member 4 (KCNN4, Accession NM_002250), a gene which forms a voltage-independent potassium channel that is activated by intracellular calcium. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNN4. The function of KCNN4 has been established by previous studies. The calcium-activated potassium channels (KCa channels) have been classified into 3 groups. Large conductance (BK) channels are gated by the concerted actions of internal

calcium ions and membrane potential and have a unit conductance of 100 to 220 picoSiemens (pS). Intermediate conductance (IK) and small conductance (SK) channels are gated solely by internal calcium ions, with a unit conductance of 20 to 85 pS and 2 to 20 pS, respectively, and are more sensitive to calcium than are BK channels. Each type of channel shows a distinct pharmacology (Ishii et al., 1997). Joiner et al. (1997) cloned cDNAs encoding KCNN4, which they called SK4. The predicted 427-amino acid sequence of KCNN4 was approximately 40% identical to that of the rat and human SK channel proteins rSK1, rSK2, rSK3 and hSK1. Sequence analysis revealed that, like the SK channel proteins, KCNN4 contained 6 putative transmembrane domains, a conserved pore region, and a leucine zipper-like motif near the C terminus. When expressed in Chinese hamster ovary cells, KCNN4 generated a conductance of approximately 12 pS and had a very high affinity for calcium. By Northern analysis, the authors found that KCNN4 was expressed as 2.6-kb and 3.8-kb transcripts in placenta and at lower levels in lung and pancreas. On the basis of its expression pattern, physiologic properties, and low homology to other SK channel proteins, Joiner et al. (1997) proposed that KCNN4 belongs to a new sub-

family of SK channels.

[10967] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10968] Ghanshani, S.; Coleman, M.; Gustavsson, P.; Wu, A. C.-L.; Gargus, J. J.; Gutman, G. A.; Dahl, N.; Mohrenweiser, H.; Chandy, K. G. : Human calcium-activated potassium channel gene KCNN4 maps to chromosome 19q13.2 in the region deleted in Diamond-Blackfan anemia. *Genomics* 51: 160-161, 1998. ; and

[10969] Ishii, T. M.; Silvia, C.; Hirschberg, B.; Bond, C. T.; Adelman, J. P.; Maylie, J. : A human intermediate conductance calcium-activated potassium channel. *Proc. Nat. Acad. Sci.* 94: 11651-.

[10970] Further studies establishing the function and utilities of KCNN4 are found in John Hopkins OMIM database record ID 602754, and in cited publications numbered 5883-5886 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM_139012) is another VGAM152 host target gene. MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3 are HOST TARGET binding sites found in untrans-

lated regions of mRNA encoded by MAPK14, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3, designated SEQ ID:29106, SEQ ID:29113 and SEQ ID:7002 respectively, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10971] Another function of VGAM152 is therefore inhibition of Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM_139012), a gene which is important for cytokine production; responds to changes in extracellular osmolarity. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK14. The function of MAPK14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107.P23 (Accession NM_006601) is another VGAM152 host target gene. P23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P23, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P23 BINDING SITE, designated SEQ ID:13380, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10972] Another function of VGAM152 is therefore inhibition of P23 (Accession NM_006601), a gene which is a component of unstimulated progesterone receptor complex. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P23. The function of P23 has been established by previous studies. P23 was first observed as a component of the unactivated avian progesterone receptor complex, along with HSP70 (see OMIM Ref. No. 140550) and HSP90 (see OMIM Ref. No. 140571) (Smith et al., 1990). Using the chicken p23 sequence as probe, Johnson et al. (1994) cloned P23 from a human testis cDNA library. The deduced 160-amino acid protein has a calculated molecular mass of about 19 kD and contains several putative phosphorylation sites. P23 shares about 96% sequence identity with the chicken homolog. Western blot analysis revealed a 23-kD band in tissue and cell lysates from several mammalian species including human.

Freeman and Yamamoto (2002) determined that the P23 molecular chaperone localizes to genomic response elements in a hormone-dependent manner and showed that it could disrupt receptor-mediated transcriptional activation.

[10973] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10974] Johnson, J. L.; Beito, T. G.; Krco, C. J.; Toft, D. O. : Characterization of a novel 23-kilodalton protein of unactive progesterone receptor complexes. *Molec. Cell. Biol.* 14: 1956-1963, 1994. ; and

[10975] Freeman, B. C.; Yamamoto, K. R. : Disassembly of transcriptional regulatory complexes by molecular chaperones. *Science* 296: 2232-2235, 2002.

[10976] Further studies establishing the function and utilities of P23 are found in John Hopkins OMIM database record ID 607061, and in cited publications numbered 5402-5404 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_012231) is another VGAM152 host target gene. PRDM2 BINDING SITE1 and PRDM2 BINDING SITE2 are

HOST TARGET binding sites found in untranslated regions of mRNA encoded by PRDM2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE1 and PRDM2 BINDING SITE2, designated SEQ ID:14534 and SEQ ID:18001 respectively, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10977] Another function of VGAM152 is therefore inhibition of PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_012231), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM2. The function of PRDM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Serine Hydroxymethyltransferase 2 (mitochondrial) (SHMT2, Accession NM_005412) is another VGAM152 host target gene. SHMT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by SHMT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHMT2 BINDING SITE, designated SEQ ID:11879, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10978] Another function of VGAM152 is therefore inhibition of Serine Hydroxymethyltransferase 2 (mitochondrial) (SHMT2, Accession NM_005412), a gene which interconverts serine and glycine. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHMT2. The function of SHMT2 has been established by previous studies. By human-hamster hybrids, Kao et al. (1969) have demonstrated that the human complement for hamster glycine(-)A auxotroph is located on chromosome 12. The enzyme, presence of which in human cells complements the deficiency in hamster cells, is thought to be serine hydroxymethyltransferase. Law and Kao (1978) summarized data suggesting the order 12pter--TPI--GAPD--SHMT on chromosome 12. SHMT lies on the proximal part of 12q between the centromere and Pep-B. The regional localiza-

tion is 12q12–q14. Garrow et al. (1993) cloned human cDNAs for both the cytosolic and the mitochondrial SHMT isozymes by functional complementation of an *Escherichia coli* glyA mutant with a human cDNA library. By fluorescence in situ hybridization, they demonstrated that the cytosolic (SHMT1; 182144) and mitochondrial (SHMT2) genes localized to 17p11.2 and 12q13, respectively. The high degree of nucleotide sequence identity between the 2 isozymes, as well as the presence of keratin genes in both chromosomal regions, was considered to be consistent with the occurrence of a duplication event in the origin of these regions of chromosomes 12 and 17. Stover et al. (1997) found that the SHMT2 gene, called mSHMT by them, is composed of 11 exons and spans approximately 4.5 kb. Amino acids 1 to 29 encode a mitochondrial import presequence; the corresponding mRNA contains 2 potential ATG start sites, which are encoded by separate exons. Translation initiation from the first ATG is not essential for SHMT2 activity and import into the mitochondria.

[10979] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [10980] Law, M. L.; Kao, F.-T. : Induced segregation of human syntenic genes by 5-bromodeoxyuridine plus near-visible light. *Somat. Cell Genet.* 4: 465-476, 1978. ; and
- [10981] Stover, P. J.; Chen, L. H.; Suh, J. R.; Stover, D. M.; Key-omarsi, K.; Shane, B. : Molecular cloning, characterization, and regulation of the human mitochondrial serine hydroxymethyltransfer.
- [10982] Further studies establishing the function and utilities of SHMT2 are found in John Hopkins OMIM database record ID 138450, and in cited publications numbered 4810-481 and 4969 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 35 (CMP-sialic acid transporter), Member 1 (SLC35A1, Accession NM_006416) is another VGAM152 host target gene. SLC35A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC35A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC35A1 BINDING SITE, designated SEQ ID:13126, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10983] Another function of VGAM152 is therefore inhibition of Solute Carrier Family 35 (CMP–sialic acid transporter), Member 1 (SLC35A1, Accession NM_006416), a gene which transports cmp–sialic acid from the cytosol into golgi vesicles. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC35A1. The function of SLC35A1 has been established by previous studies. By searching an EST database, followed by 5–prime RACE on an adult liver cDNA pool, Ishida et al. (1996) obtained a cDNA encoding SLC35A1, the human homolog of the murine cytidine monophosphate (CMP)–sialic acid transporter. The deduced 337–amino acid protein is approximately 65% identical to SLC35A2 (OMIM Ref. No. 314375). Ishida et al. (1998) used wheat germ agglutination sensitivity assays and flow cytometry analysis to show that SLC35A1 corrects the sialic acid transport deficiency in a mutant cell line. Immunoblot analysis showed that SLC35A1 is expressed as an approximately 29–kD protein in microsomal vesicles. Immunofluorescence microscopy demonstrated expression in the Golgi region, with the C terminus exposed to the cytosol. Northern blot analysis revealed ubiquitous expression of a 2.0–kb transcript.

[10984] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10985] Ishida, N.; Ito, M.; Yoshioka, S.; Sun-Wada, G.-H.; Kawakita, M. : Functional expression of human Golgi CMP-sialic acid transporter in the Golgi complex of a transporter-deficient Chinese hamster ovary cell mutant. J. Biochem. 124: 171-178, 1998. ; and

[10986] Ishida, N.; Miura, N.; Yoshioka, S.; Kawakita, M. : Molecular cloning and characterization of a novel isoform of the human UDP-galactose transporter, and of related complementary DNAs be.

[10987] Further studies establishing the function and utilities of SLC35A1 are found in John Hopkins OMIM database record ID 605634, and in cited publications numbered 450 and 8228 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1 (SMARCD1, Accession NM_139071) is another VGAM152 host target gene. SMARCD1 BINDING SITE1 and SMARCD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SMARCD1, cor-

responding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCD1 BINDING SITE1 and SMARCD1 BINDING SITE2, designated SEQ ID:29145 and SEQ ID:9047 respectively, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10988] Another function of VGAM152 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1 (SMARCD1, Accession NM_139071), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1. The function of SMARCD1 has been established by previous studies. Chromatin is actively remodeled during development. Chromatin remodeling of certain genes appears to precede their transcriptional activation. In yeast, the multisubunit SWI/SNF complex is thought to be responsible for chromatin remodeling. Wang et al. (1996) isolated an analogous SWI/SNF complex from the human YT cell line. They found that the resultant complexes are composed of 9 to 12 polypeptides,

which they termed BAFs (for BRG1-associated factors).

Wang et al. (1996) isolated the BAF60a subunit, which encodes a polypeptide of 435 amino acids and is homologous to the yeast SWP73 gene. The authors used BAF60a as a probe to isolate 2 closely related homologs, BAF60b (OMIM Ref. No. 601736) and BAF60c (OMIM Ref. No. 601737). By PCR of a somatic cell hybrid panel and radiation hybrid analysis, Ring et al. (1998) mapped the SMARCD1 gene to chromosome 12q13-q14.

[10989] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10990] Ring, H. Z.; Vameghi-Meyers, V.; Wang, W.; Crabtree, G. R.; Francke, U. : Five SWI/SNF-related, matrix-associated, actin-dependent regulator of chromatin (SMARC) genes are dispersed in the human genome. *Genomics* 51: 140-143, 1998. ; and

[10992] Further studies establishing the function and utilities of SMARCD1 are found in John Hopkins OMIM database record ID 601735, and in cited publications numbered

9322–9323 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP434J193 (Accession XM_048452) is another VGAM152 host target gene. DKFZP434J193 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434J193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J193 BINDING SITE, designated SEQ ID:35162, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10993] Another function of VGAM152 is therefore inhibition of DKFZP434J193 (Accession XM_048452). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J193. DKFZP564M182 (Accession XM_085525) is another VGAM152 host target gene. DKFZP564M182 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564M182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of DKFZP564M182 BINDING SITE, designated SEQ ID:38220, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10994] Another function of VGAM152 is therefore inhibition of DKFZP564M182 (Accession XM_085525). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564M182. FLJ10290 (Accession NM_018047) is another VGAM152 host target gene. FLJ10290 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10290, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10290 BINDING SITE, designated SEQ ID:19797, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10995] Another function of VGAM152 is therefore inhibition of FLJ10290 (Accession NM_018047). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10290. FLJ13194 (Accession NM_025146) is another VGAM152

host target gene. FLJ13194 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13194 BINDING SITE, designated SEQ ID:24787, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10996] Another function of VGAM152 is therefore inhibition of FLJ13194 (Accession NM_025146). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13194. FLJ21870 (Accession NM_023016) is another VGAM152 host target gene. FLJ21870 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21870 BINDING SITE, designated SEQ ID:23279, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10997] Another function of VGAM152 is therefore inhibition of FLJ21870 (Accession NM_023016). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21870. H_GS165L15.1 (Accession NM_004904) is another VGAM152 host target gene. H_GS165L15.1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H_GS165L15.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H_GS165L15.1 BINDING SITE, designated SEQ ID:11338, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10998] Another function of VGAM152 is therefore inhibition of H_GS165L15.1 (Accession NM_004904). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H_GS165L15.1. KIAA0295 (Accession XM_042833) is another VGAM152 host target gene. KIAA0295 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0295, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0295 BINDING SITE, designated SEQ ID:33780, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[10999] Another function of VGAM152 is therefore inhibition of KIAA0295 (Accession XM_042833). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0295. KIAA0356 (Accession XM_038655) is another VGAM152 host target gene. KIAA0356 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0356 BINDING SITE, designated SEQ ID:32893, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11000] Another function of VGAM152 is therefore inhibition of KIAA0356 (Accession XM_038655). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0356. KIAA0853 (Accession NM_015070) is another VGAM152 host target gene. KIAA0853 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0853 BINDING SITE, designated SEQ ID:17440, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11001] Another function of VGAM152 is therefore inhibition of KIAA0853 (Accession NM_015070). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0853. KIAA1102 (Accession XM_044461) is another VGAM152 host target gene. KIAA1102 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1102 BINDING SITE, designated SEQ ID:34212, to the nucleotide sequence of VGAM152 RNA, herein designated

VGAM RNA, also designated SEQ ID:2863.

[11002] Another function of VGAM152 is therefore inhibition of KIAA1102 (Accession XM_044461). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1102. KIAA1223 (Accession XM_048747) is another VGAM152 host target gene. KIAA1223 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1223 BINDING SITE, designated SEQ ID:35245, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11003] Another function of VGAM152 is therefore inhibition of KIAA1223 (Accession XM_048747). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1223. KIAA1467 (Accession XM_049605) is another VGAM152 host target gene. KIAA1467 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1467, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1467 BINDING SITE, designated SEQ ID:35453, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11004] Another function of VGAM152 is therefore inhibition of KIAA1467 (Accession XM_049605). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1467. MGC12966 (Accession NM_032706) is another VGAM152 host target gene. MGC12966 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12966 BINDING SITE, designated SEQ ID:26419, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11005] Another function of VGAM152 is therefore inhibition of MGC12966 (Accession NM_032706). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC12966. MGC2306 (Accession NM_032638) is another VGAM152 host target gene. MGC2306 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2306 BINDING SITE, designated SEQ ID:26353, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11006] Another function of VGAM152 is therefore inhibition of MGC2306 (Accession NM_032638). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2306. ORM1-like 2 (*S. cerevisiae*) (ORMDL2, Accession NM_014182) is another VGAM152 host target gene. ORMDL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ORMDL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ORMDL2 BINDING SITE, designated SEQ

ID:15467, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11007] Another function of VGAM152 is therefore inhibition of ORM1-like 2 (*S. cerevisiae*) (ORMDL2, Accession NM_014182). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ORMDL2. P66 (Accession NM_020699) is another VGAM152 host target gene. P66 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P66, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P66 BINDING SITE, designated SEQ ID:21844, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11008] Another function of VGAM152 is therefore inhibition of P66 (Accession NM_020699). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P66. PRO0159 (Accession NM_014118) is another VGAM152 host target gene. PRO0159 BINDING SITE is HOST TARGET

binding site found in the 5' untranslated region of mRNA encoded by PRO0159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0159 BINDING SITE, designated SEQ ID:15372, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11009] Another function of VGAM152 is therefore inhibition of PRO0159 (Accession NM_014118). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0159. LOC144740 (Accession XM_084959) is another VGAM152 host target gene. LOC144740 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144740, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144740 BINDING SITE, designated SEQ ID:37786, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11010] Another function of VGAM152 is therefore inhibition of

LOC144740 (Accession XM_084959). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144740. LOC145820 (Accession XM_085246) is another VGAM152 host target gene. LOC145820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145820 BINDING SITE, designated SEQ ID:37994, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11011] Another function of VGAM152 is therefore inhibition of LOC145820 (Accession XM_085246). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145820. LOC148195 (Accession XM_097419) is another VGAM152 host target gene. LOC148195 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC148195 BINDING SITE, designated SEQ ID:40873, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11012] Another function of VGAM152 is therefore inhibition of LOC148195 (Accession XM_097419). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148195. LOC148811 (Accession XM_086326) is another VGAM152 host target gene. LOC148811 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148811 BINDING SITE, designated SEQ ID:38598, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11013] Another function of VGAM152 is therefore inhibition of LOC148811 (Accession XM_086326). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148811. LOC148930 (Accession XM_086369) is an-

other VGAM152 host target gene. LOC148930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148930 BINDING SITE, designated SEQ ID:38619, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11014] Another function of VGAM152 is therefore inhibition of LOC148930 (Accession XM_086369). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148930. LOC149706 (Accession XM_097718) is another VGAM152 host target gene. LOC149706 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149706 BINDING SITE, designated SEQ ID:41059, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11015] Another function of VGAM152 is therefore inhibition of LOC149706 (Accession XM_097718). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149706. LOC152765 (Accession XM_087519) is another VGAM152 host target gene. LOC152765 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152765 BINDING SITE, designated SEQ ID:39319, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11016] Another function of VGAM152 is therefore inhibition of LOC152765 (Accession XM_087519). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152765. LOC157247 (Accession XM_088275) is another VGAM152 host target gene. LOC157247 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157247, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157247 BINDING SITE, designated SEQ ID:39574, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11017] Another function of VGAM152 is therefore inhibition of LOC157247 (Accession XM_088275). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157247. LOC201164 (Accession XM_113904) is another VGAM152 host target gene. LOC201164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201164 BINDING SITE, designated SEQ ID:42532, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11018] Another function of VGAM152 is therefore inhibition of LOC201164 (Accession XM_113904). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC201164. LOC221738 (Accession XM_168097) is another VGAM152 host target gene. LOC221738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221738 BINDING SITE, designated SEQ ID:45029, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11019] Another function of VGAM152 is therefore inhibition of LOC221738 (Accession XM_168097). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221738. LOC221935 (Accession XM_166537) is another VGAM152 host target gene. LOC221935 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221935 BINDING SITE, designated SEQ ID:44499, to the nucleotide sequence of VGAM152 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2863.

[11020] Another function of VGAM152 is therefore inhibition of LOC221935 (Accession XM_166537). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221935. LOC222128 (Accession XM_166560) is another VGAM152 host target gene. LOC222128 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222128 BINDING SITE, designated SEQ ID:44541, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11021] Another function of VGAM152 is therefore inhibition of LOC222128 (Accession XM_166560). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222128. LOC253639 (Accession XM_171060) is another VGAM152 host target gene. LOC253639 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253639, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253639 BINDING SITE, designated SEQ ID:45854, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11022] Another function of VGAM152 is therefore inhibition of LOC253639 (Accession XM_171060). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253639. LOC91807 (Accession XM_040819) is another VGAM152 host target gene. LOC91807 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91807, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91807 BINDING SITE, designated SEQ ID:33385, to the nucleotide sequence of VGAM152 RNA, herein designated VGAM RNA, also designated SEQ ID:2863.

[11023] Another function of VGAM152 is therefore inhibition of LOC91807 (Accession XM_040819). Accordingly, utilities of VGAM152 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC91807. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 153 (VGAM153) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11024] VGAM153 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM153 was detected is described hereinabove with reference to Figs. 1–8.

[11025] VGAM153 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM153 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11026] VGAM153 gene encodes a VGAM153 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM153 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM153 precursor RNA is designated SEQ

ID:139, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:139 is located at position 49690 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11027] VGAM153 precursor RNA folds onto itself, forming VGAM153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11028] An enzyme complex designated DICER COMPLEX, `dices` the VGAM153 folded precursor RNA into VGAM153 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM153 RNA is designated SEQ ID:2864, and

is provided hereinbelow with reference to the sequence listing part.

[11029] VGAM153 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM153 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM153 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11030] VGAM153 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM153 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM153 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM153 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM153 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11031] The complementary binding of VGAM153 RNA, herein designated VGAM RNA, to host target binding sites on VGAM153 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM153 host target RNA into VGAM153 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11032] It is appreciated that VGAM153 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM153 host target genes. The mRNA of each one of this plurality of VGAM153 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM153 RNA, herein designated VGAM RNA, and which when bound by VGAM153 RNA causes inhibition of translation of respective one or more VGAM153 host target proteins.

[11033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM153 gene, herein designated VGAM GENE, on one or more VGAM153 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11034] It is yet further appreciated that a function of VGAM153 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM153 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM153 correlate with, and may be deduced from, the identity of the host target genes which VGAM153 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11035] Nucleotide sequences of the VGAM153 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM153 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM153 are further described hereinbelow with reference to Table 1.

[11036] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM153 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM153 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11037] As mentioned hereinabove with reference to Fig. 1, a function of VGAM153 gene, herein designated VGAM is inhibition of expression of VGAM153 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM153 correlate with, and may be deduced from, the identity of the target genes which VGAM153 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11038] A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession XM_116974) is a VGAM153 host target gene. AKAP13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:43178, to the nucleotide sequence of VGAM153 RNA, herein designated VGAM RNA, also designated SEQ ID:2864.

[11039] A function of VGAM153 is therefore inhibition of A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession XM_116974), a gene which regulates subcellular localization of type II cAMP-dependent PKA. Accordingly, utilities of VGAM153 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with AKAP13. The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM17.FLJ12700 (Accession NM_024910) is another VGAM153 host target gene. FLJ12700 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12700 BINDING SITE, designated SEQ ID:24412, to the nucleotide sequence of VGAM153 RNA, herein designated VGAM RNA, also designated SEQ ID:2864.

[11040] Another function of VGAM153 is therefore inhibition of FLJ12700 (Accession NM_024910). Accordingly, utilities of VGAM153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12700. Hippocalcin Like 4 (HPCAL4, Accession NM_016257) is another VGAM153 host target gene. HPCAL4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HPCAL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPCAL4 BINDING SITE, designated SEQ ID:18385, to the nucleotide sequence of VGAM153 RNA, herein designated VGAM RNA, also designated SEQ ID:2864.

[11041] Another function of VGAM153 is therefore inhibition of Hippocalcin Like 4 (HPCAL4, Accession NM_016257). Accordingly, utilities of VGAM153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCAL4. LOC146243 (Accession XM_096956) is another VGAM153 host target gene. LOC146243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146243 BINDING SITE, designated SEQ ID:40673, to the nucleotide sequence of VGAM153 RNA, herein designated VGAM RNA, also designated SEQ ID:2864.

[11042] Another function of VGAM153 is therefore inhibition of LOC146243 (Accession XM_096956). Accordingly, utilities of VGAM153 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC146243. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 154 (VGAM154) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11043] VGAM154 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM154 was detected is described hereinabove with reference to Figs. 1–8.

[11044] VGAM154 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM154 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11045] VGAM154 gene encodes a VGAM154 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM154 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM154 precursor RNA is designated SEQ

ID:140, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:140 is located at position 33147 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11046] VGAM154 precursor RNA folds onto itself, forming VGAM154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11047] An enzyme complex designated DICER COMPLEX, `dices` the VGAM154 folded precursor RNA into VGAM154 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM154 RNA is designated SEQ ID:2865, and

is provided hereinbelow with reference to the sequence listing part.

[11048] VGAM154 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM154 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM154 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11049] VGAM154 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM154 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM154 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM154 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM154 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11050] The complementary binding of VGAM154 RNA, herein designated VGAM RNA, to host target binding sites on VGAM154 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM154 host target RNA into VGAM154 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11051] It is appreciated that VGAM154 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM154 host target genes. The mRNA of each one of this plurality of VGAM154 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM154 RNA, herein designated VGAM RNA, and which when bound by VGAM154 RNA causes inhibition of translation of respective one or more VGAM154 host target proteins.

[11052] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM154 gene, herein designated VGAM GENE, on one or more VGAM154 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11053] It is yet further appreciated that a function of VGAM154 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM154 correlate with, and may be deduced from, the identity of the host target genes which VGAM154 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11054] Nucleotide sequences of the VGAM154 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM154 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM154 are further described hereinbelow with reference to Table 1.

[11055] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM154 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM154 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11056] As mentioned hereinabove with reference to Fig. 1, a function of VGAM154 gene, herein designated VGAM is inhibition of expression of VGAM154 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM154 correlate with, and may be deduced from, the identity of the target genes which VGAM154 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11057] MDM1 (Accession NM_020128) is a VGAM154 host target gene. MDM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MDM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDM1 BINDING SITE, designated SEQ ID:21322, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:2865.

[11058] A function of VGAM154 is therefore inhibition of MDM1 (Accession NM_020128). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDM1. Tumor Necrosis Factor Receptor Superfamily, Member 8

(TNFRSF8, Accession NM_001243) is another VGAM154 host target gene. TNFRSF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF8 BINDING SITE, designated SEQ ID:6911, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:2865.

[11059] Another function of VGAM154 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 8 (TNFRSF8, Accession NM_001243), a gene which regulates gene expression through activation of nf-kappab. Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF8. The function of TNFRSF8 has been established by previous studies. By in vitro binding, immunoprecipitation, immunoblot, and yeast 2-hybrid analyses, Aizawa et al. (1997) showed that TRAF2 (OMIM Ref. No. 601895) and TRAF5 (OMIM Ref. No. 602356) interact with overlapping but distinct sequences in the C-terminal region of CD30 and mediate the activation of nuclear fac-

tor kappa-B (see OMIM Ref. No. 164011). Kurts et al. (1999) identified a new mechanism that protects against autoimmunity mediated through CD30. CD30 is expressed by activated, but not by resting, B or T cells. Using a model system in which ovalbumin-specific CD8+ T cells from the OT-I transgenic line were adoptively transferred into unirradiated transgenic mice that expressed ovalbumin in the pancreatic beta cells and the proximal renal tubular cells, Kurts et al. (1999) found that wildtype OT-I cells caused diabetes only when adoptively transferred in large numbers (greater than 250,000), with lower doses being effectively tolerized. CD30-deficient islet-specific CD8+ T cells were roughly 6,000-fold more autoaggressive than wildtype cells, with the transfer of as few as 160 CD30-deficient T cells leading to the complete destruction of pancreatic islets and the rapid onset of diabetes (within 4 days). Kurts et al. (1999) showed that in the absence of CD30 signaling, cells activated but not yet deleted by the CD95 (OMIM Ref. No. 134637)-dependent cross-tolerance mechanism gain the ability to proliferate extensively upon secondary encounter with antigen on parenchymal tissues, such as the pancreatic islets. Thus, CD30 signaling limits the proliferative potential of autore-

active CD8 effector T cells, and protects the body against autoimmunity.

[11060] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11061] Aizawa, S.; Nakano, H.; Ishida, T.; Horie, R.; Nagai, M.; Ito, K.; Yagita, H.; Okumura, K.; Inoue, J.; Watanabe, T. : Tumor necrosis factor receptor-associated factor (TRAF) 5 and TRAF2 are involved in CD30-mediated NF-kappa-B activation. J. Biol. Chem. 272: 2042-2045, 1997. ; and

[11062] Kurts, C.; Carbone, F. R.; Krummel, M. F.; Koch, K. M.; Miller, J. F. A. P.; Heath, W. R. : Signalling through CD30 protects against autoimmune diabetes mediated by CD8 T cells. Nature 3.

[11063] Further studies establishing the function and utilities of TNFRSF8 are found in John Hopkins OMIM database record ID 153243, and in cited publications numbered 11509-11510, 347 and 11511-11513 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ13114 (Accession NM_024541) is another VGAM154 host target gene. FLJ13114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13114, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13114 BINDING SITE, designated SEQ ID:23751, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:2865.

[11064] Another function of VGAM154 is therefore inhibition of FLJ13114 (Accession NM_024541). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13114. HCA4 (Accession XM_085287) is another VGAM154 host target gene. HCA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:38025, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:2865.

[11065] Another function of VGAM154 is therefore inhibition of HCA4 (Accession XM_085287). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with HCA4. Insulin-like Growth Factor 2, Antisense (IGF2AS, Accession NM_016412) is another VGAM154 host target gene. IGF2AS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IGF2AS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGF2AS BINDING SITE, designated SEQ ID:18542, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:2865.

[11066] Another function of VGAM154 is therefore inhibition of Insulin-like Growth Factor 2, Antisense (IGF2AS, Accession NM_016412). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF2AS. KIAA0476 (Accession NM_014856) is another VGAM154 host target gene. KIAA0476 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of KIAA0476 BINDING SITE, designated SEQ ID:16904, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:2865.

[11067] Another function of VGAM154 is therefore inhibition of KIAA0476 (Accession NM_014856). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0476. KIAA0652 (Accession NM_014741) is another VGAM154 host target gene. KIAA0652 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0652, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0652 BINDING SITE, designated SEQ ID:16410, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:2865.

[11068] Another function of VGAM154 is therefore inhibition of KIAA0652 (Accession NM_014741). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0652. KIAA0937 (Accession XM_166213) is another

VGAM154 host target gene. KIAA0937 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0937 BINDING SITE, designated SEQ ID:44018, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:2865.

[11069] Another function of VGAM154 is therefore inhibition of KIAA0937 (Accession XM_166213). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0937. Signal Transducer and Activator of Transcription 2, 113kDa (STAT2, Accession NM_005419) is another VGAM154 host target gene. STAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAT2 BINDING SITE, designated SEQ ID:11892, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:2865.

[11070] Another function of VGAM154 is therefore inhibition of Signal Transducer and Activator of Transcription 2, 113kDa (STAT2, Accession NM_005419). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT2. LOC145123 (Accession XM_041473) is another VGAM154 host target gene. LOC145123 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145123 BINDING SITE, designated SEQ ID:33533, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:2865.

[11071] Another function of VGAM154 is therefore inhibition of LOC145123 (Accession XM_041473). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145123. LOC151512 (Accession XM_098072) is another VGAM154 host target gene. LOC151512 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC151512, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151512 BINDING SITE, designated SEQ ID:41363, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:2865.

[11072] Another function of VGAM154 is therefore inhibition of LOC151512 (Accession XM_098072). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151512. LOC220549 (Accession XM_167521) is another VGAM154 host target gene. LOC220549 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220549 BINDING SITE, designated SEQ ID:44649, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:2865.

[11073] Another function of VGAM154 is therefore inhibition of LOC220549 (Accession XM_167521). Accordingly, utilities

of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220549. LOC220827 (Accession XM_166052) is another VGAM154 host target gene. LOC220827 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220827 BINDING SITE, designated SEQ ID:43846, to the nucleotide sequence of VGAM154 RNA, herein designated VGAM RNA, also designated SEQ ID:2865.

[11074] Another function of VGAM154 is therefore inhibition of LOC220827 (Accession XM_166052). Accordingly, utilities of VGAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220827. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 155 (VGAM155) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11075] VGAM155 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM155 was detected is described hereinabove with reference to Figs. 1–8.

[11076] VGAM155 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM155 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11077] VGAM155 gene encodes a VGAM155 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM155 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM155 precursor RNA is designated SEQ ID:141, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:141 is located at position 234589 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11078] VGAM155 precursor RNA folds onto itself, forming VGAM155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[11079] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM155 folded precursor RNA into VGAM155 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 45%) nucleotide se-
quence of VGAM155 RNA is designated SEQ ID:2866, and
is provided hereinbelow with reference to the sequence
listing part.

[11080] VGAM155 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM155 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM155 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[11081] VGAM155 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM155 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM155 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM155 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM155 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[11082] The complementary binding of VGAM155 RNA, herein designated VGAM RNA, to host target binding sites on VGAM155 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM155 host target RNA into VGAM155 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11083] It is appreciated that VGAM155 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM155 host target genes. The mRNA of each one of this plurality of VGAM155 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM155 RNA, herein designated VGAM RNA, and which when bound by VGAM155 RNA causes inhibition of translation of respective one or more VGAM155 host target proteins.

[11084] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM155 gene, herein designated VGAM GENE, on one or

more VGAM155 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11085] It is yet further appreciated that a function of VGAM155 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM155 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM155 correlate with, and may be deduced from, the identity of the host target genes which VGAM155 binds and inhibits, and the function of these host target genes, as elaborated herein-

below.

- [11086] Nucleotide sequences of the VGAM155 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM155 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM155 are further described hereinbelow with reference to Table 1.
- [11087] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM155 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM155 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [11088] As mentioned hereinabove with reference to Fig. 1, a function of VGAM155 gene, herein designated VGAM is inhibition of expression of VGAM155 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM155 correlate with, and may be deduced from, the identity of the target genes which VGAM155 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

- [11089] Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM_003349) is a VGAM155 host target gene. UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE2V1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3, designated SEQ ID:9374, SEQ ID:22526 and SEQ ID:22773 respectively, to the nucleotide sequence of VGAM155 RNA, herein designated VGAM RNA, also designated SEQ ID:2866.
- [11090] A function of VGAM155 is therefore inhibition of Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM_003349), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of VGAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1. The function of UBE2V1 has been established by previous studies. Rothofsky and Lin (1997) isolated human brain cDNAs encoding UBE2V1, which they called CROC1. They identified 2 alternative 5-prime CROC1 cDNA sequences, which resulted in predicted 221- and 170-amino acid proteins that differ at

their N-terminal ends. The CROC1 isoforms have an acidic domain and a C-terminal basic domain. They show sequence similarity to ubiquitin-conjugating enzymes (UBCs, or E2s, e.g., UBE2D1; 602961) but lack the conserved cysteine residue that is critical for the catalytic activity of E2s. The CROC1 C-terminal domain has 42% sequence identity with the potential DNA-binding domain of TAFII250 (TAF2A; 313650). Immunofluorescence microscopy showed that recombinant CROC1 was located in the nucleus, excluding the nucleolar organizer regions. The authors demonstrated that CROC1 can cause transcriptional activation of the human FOS (OMIM Ref. No. 164810) promoter. Northern blot analysis detected approximately 2.1- and 2.5-kb CROC1 transcripts in all human tissues examined, with the highest levels in brain, skeletal muscle, and kidney. Sancho et al. (1998) isolated partial human intestinal epithelial cell cDNAs containing the 3-prime coding sequence and 3-prime untranslated region of UBE2V1, which they called UEV1. The UEV1 gene contains at least 6 exons and has at least 3 alternative polyadenylation sites in the 3-prime untranslated region. RT-PCR identified 4 alternatively spliced UEV1 transcripts that encode proteins with identical 90-amino acid C-

terminal sequences, including the region homologous to the conserved Ubc domain of E2 enzymes, but unique N-terminal sequences. The 140-amino acid C terminus of the deduced 221- and 170-amino acid UEV1 isoforms identified by Rothofsky and Lin (1997) is 90% identical to UEV2 (UBE2V2; 603001); it is 18%, 24%, and 22% identical to the Ubc domain of human UBE2I (OMIM Ref. No. 601661), *S. cerevisiae* UBC4 and UBC7, and *A. thaliana* UBC1, respectively. The authors showed that UEV1 does not have ubiquitin-conjugating activity in vitro. UEV1 transcripts were downregulated upon differentiation of a colon carcinoma cell line. Constitutive expression of exogenous UEV1 protein in these colon carcinoma cells inhibited their capacity to differentiate upon confluence and induced changes in their cell cycle behavior, which was associated with an inhibition of the mitotic kinase CDK1 (see OMIM Ref. No. CDC2; 116940).

[11091] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11092] Rothofsky, M. L.; Lin, S. L. : CROC-1 encodes a protein which mediates transcriptional activation of the human FOS promoter. *Gene* 195: 141-149, 1997. ; and

[11093] Sancho, E.; Vila, M. R.; Sanchez-Pulido, L.; Lozano, J. J.; Paciucci, R.; Nadal, M.; Fox, M.; Harvey, C.; Bercovich, B.; Loukili, N.; Ciechanover, A.; Lin, S. L.; Sanz, F.; Estivill, X.

[11094] Further studies establishing the function and utilities of UBE2V1 are found in John Hopkins OMIM database record ID 602995, and in cited publications numbered 9020–5411 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC157349 (Accession XM_088298) is another VGAM155 host target gene. LOC157349 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157349 BINDING SITE, designated SEQ ID:39586, to the nucleotide sequence of VGAM155 RNA, herein designated VGAM RNA, also designated SEQ ID:2866.

[11095] Another function of VGAM155 is therefore inhibition of LOC157349 (Accession XM_088298). Accordingly, utilities of VGAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157349. LOC170409 (Accession XM_096330) is an–

other VGAM155 host target gene. LOC170409 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170409 BINDING SITE, designated SEQ ID:40315, to the nucleotide sequence of VGAM155 RNA, herein designated VGAM RNA, also designated SEQ ID:2866.

[11096] Another function of VGAM155 is therefore inhibition of LOC170409 (Accession XM_096330). Accordingly, utilities of VGAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170409. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 156 (VGAM156) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11097] VGAM156 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM156 was detected is described

hereinabove with reference to Figs. 1–8.

[11098] VGAM156 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM156 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11099] VGAM156 gene encodes a VGAM156 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM156 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM156 precursor RNA is designated SEQ ID:142, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:142 is located at position 29183 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11100] VGAM156 precursor RNA folds onto itself, forming VGAM156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11101] An enzyme complex designated DICER COMPLEX, `dices` the VGAM156 folded precursor RNA into VGAM156 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM156 RNA is designated SEQ ID:2867, and is provided hereinbelow with reference to the sequence listing part.

[11102] VGAM156 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM156 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM156 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11103] VGAM156 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM156 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM156 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM156 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM156 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[11104] The complementary binding of VGAM156 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM156 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM156 host target RNA into VGAM156 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11105] It is appreciated that VGAM156 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM156 host target genes. The mRNA of each one of this plurality of VGAM156 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM156 RNA, herein designated VGAM RNA, and which when bound by VGAM156 RNA causes inhibition of translation of respective one or more VGAM156 host target proteins.

[11106] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM156 gene, herein designated VGAM GENE, on one or more VGAM156 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11107] It is yet further appreciated that a function of VGAM156 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM156 correlate with, and may be deduced from, the identity of the host target genes which VGAM156 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11108] Nucleotide sequences of the VGAM156 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM156 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM156 are further described hereinbelow with reference to Table 1.

[11109] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM156 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM156 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11110] As mentioned hereinabove with reference to Fig. 1, a function of VGAM156 gene, herein designated VGAM is inhibition of expression of VGAM156 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM156 correlate with, and may be deduced from, the identity of the target genes which VGAM156 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11111] ATPase, Class VI, Type 11A (ATP11A, Accession XM_085028) is a VGAM156 host target gene. ATP11A BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by ATP11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11A BINDING SITE, designated SEQ ID:37802, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:2867.

[11112] A function of VGAM156 is therefore inhibition of ATPase, Class VI, Type 11A (ATP11A, Accession XM_085028). Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11A. D12S2489E (Accession NM_007360) is another VGAM156 host target gene. D12S2489E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by D12S2489E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D12S2489E BINDING SITE, designated SEQ ID:14292, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:2867.

[11113] Another function of VGAM156 is therefore inhibition of

D12S2489E (Accession NM_007360), a gene which interacts in the inhibition and activation of NK cells. Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D12S2489E. The function of D12S2489E has been established by previous studies. Bauer et al. (1999) found that NKG2D is expressed on gamma/delta T cells, CD8-alpha (OMIM Ref. No. 186910)/-beta (OMIM Ref. No. 186730)-positive T cells, and natural killer cells and is a receptor for MICA (OMIM Ref. No. 600169). MICA binding to NKG2D activated cytolytic responses of gamma/delta T cells and NK cells against transfectants and epithelial tumor cells expressing MICA. The authors noted that these results define an activating immunoreceptor-MHC ligand interaction that may promote antitumor NK and T-cell responses. Wu et al. (1999) demonstrated that NKG2D and DAP10 (OMIM Ref. No. 604089) interact specifically to form an activating immunoreceptor complex. Sutherland et al. (2002) showed that an NKG2D fusion protein or antibody to NKG2D blocked the binding of UL16-binding proteins, or ULBPs (see OMIM Ref. No. ULBP1; 605697), and MICs to primary NK cells, indicating that NKG2D is the counterstructure for ULBPs. Immunoblot analysis showed

that ULBPs stimulate marked protein phosphorylation, notably of JAK2 (OMIM Ref. No. 147796) and STAT5 (see OMIM Ref. No. 604260), and induce activation of the ERK (see OMIM Ref. No. 601795) mitogen-activated protein kinase (MAPK) pathway. Immunoprecipitation analysis demonstrated that ULBP triggering induces phosphorylation of both the p85 (OMIM Ref. No. 171833) and p110 (OMIM Ref. No. 601232) subunits of phosphatidylinositol 3-kinase (PI3K) through DAP10, the NKG2D signaling partner. PI3K, in turn, was found to be required for ULBP-induced cytokine and chemokine production. In all cases, Sutherland et al. (2002) observed that ULBP3 (OMIM Ref. No. 605699) bound more weakly to NKG2D and induced weaker signaling responses than did ULBP2 (OMIM Ref. No. 605698) or ULBP1. Animal model experiments lend further support to the function of D12S2489E. Colucci et al. (2002) noted that humans with mutations in ZAP70 (OMIM Ref. No. 176947) have T-cell immunodeficiency, that mice lacking Zap70 have blocked T-cell development, and that mice lacking Syk (OMIM Ref. No. 600085) have a failure of B-cell development. NK cells express both molecules, which associate with immunoreceptor tyrosine-based activation motifs (ITAMs). Using mice deficient

in both Zap70 and Syk, Colucci et al. (2002) observed NK cell activity comparable to that in wildtype mice. The mutant cells expressed Nkg2d and were able to lyse targets with and without Nkg2d ligands in vitro and in vivo. However, wildtype cells, but not the double-deficient cells, responded to CD16 (OMIM Ref. No. 146740) and Ly49d (see OMIM Ref. No. 604274) cross-linking with increased cytotoxicity, suggesting that these 2 ITAM-bearing receptors are unable to signal in the mutant cells. Inhibitors of PI3K or Src kinases blocked and, in combination, abrogated cytotoxic activity in the mutant cells, whereas inhibition of both kinases was required to reduce wildtype NK activity. Colucci et al. (2002) concluded that intracellular signaling in the adaptive immune system, i.e., in B and T cells, is fundamentally different from that in the NK cells of the innate immune system.

[11114] It is appreciated that the abovementioned animal model for D12S2489E is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[11115] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [11116] Sutherland, C. L.; Chalupny, N. J.; Schooley, K.; Vanden-Bos, T.; Kubin, M.; Cosman, D. : UL16-binding proteins, novel MHC class I-related proteins, bind to NKG2D and activate multiple signaling pathways in primary NK cells. *J. Immun.* 168: 671-679, 2002. ; and
- [11117] Groh, V.; Rhinehart, R.; Randolph-Habecker, J.; Topp, M. S.; Riddell, S. R.; Spies, T. : Costimulation of CD8-alpha-beta T cells by NKG2D via engagement by MIC induced on virus-infected.
- [11118] Further studies establishing the function and utilities of D12S2489E are found in John Hopkins OMIM database record ID 602893, and in cited publications numbered 7909, 12705-7912, 7914, 7915, 8094-242 and 2528 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP434N1511 (Accession XM_166138) is another VGAM156 host target gene. DKFZP434N1511 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434N1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N1511 BINDING SITE, designated SEQ ID:43933, to the nucleotide

sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:2867.

[11119] Another function of VGAM156 is therefore inhibition of DKFZP434N1511 (Accession XM_166138). Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N1511. LOC56906 (Accession NM_020147) is another VGAM156 host target gene. LOC56906 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC56906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56906 BINDING SITE, designated SEQ ID:21342, to the nucleotide sequence of VGAM156 RNA, herein designated VGAM RNA, also designated SEQ ID:2867.

[11120] Another function of VGAM156 is therefore inhibition of LOC56906 (Accession NM_020147). Accordingly, utilities of VGAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56906. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 157 (VGAM157) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11121] VGAM157 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM157 was detected is described hereinabove with reference to Figs. 1–8.

[11122] VGAM157 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM157 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11123] VGAM157 gene encodes a VGAM157 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM157 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM157 precursor RNA is designated SEQ ID:143, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:143 is located at position 96551 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform

virus).

[11124] VGAM157 precursor RNA folds onto itself, forming VGAM157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11125] An enzyme complex designated DICER COMPLEX, `dices` the VGAM157 folded precursor RNA into VGAM157 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM157 RNA is designated SEQ ID:2868, and is provided hereinbelow with reference to the sequence listing part.

[11126] VGAM157 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM157 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM157 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11127] VGAM157 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM157 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM157 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM157 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM157 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11128] The complementary binding of VGAM157 RNA, herein designated VGAM RNA, to host target binding sites on VGAM157 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM157 host target RNA into VGAM157 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11129] It is appreciated that VGAM157 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM157 host target genes. The mRNA of each one of this plurality of VGAM157 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM157 RNA, herein designated VGAM RNA, and which when bound by VGAM157 RNA causes inhibition of translation of respective one or more VGAM157 host target proteins.

[11130] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM157 gene, herein designated VGAM GENE, on one or more VGAM157 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11131] It is yet further appreciated that a function of VGAM157 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific func-

tions, and accordingly utilities, of VGAM157 correlate with, and may be deduced from, the identity of the host target genes which VGAM157 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [11132] Nucleotide sequences of the VGAM157 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM157 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM157 are further described hereinbelow with reference to Table 1.
- [11133] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM157 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM157 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [11134] As mentioned hereinabove with reference to Fig. 1, a function of VGAM157 gene, herein designated VGAM is inhibition of expression of VGAM157 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM157 correlate with, and may be deduced from, the identity of the target genes which VGAM157 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11135] Adenylate Cyclase 2 (brain) (ADCY2, Accession XM_036383) is a VGAM157 host target gene. ADCY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY2 BINDING SITE, designated SEQ ID:32433, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:2868.

[11136] A function of VGAM157 is therefore inhibition of Adenylate Cyclase 2 (brain) (ADCY2, Accession XM_036383), a gene which Adenylate cyclase (type 2), an ATP-pyrophosphate lyase; converts ATP to cAMP. Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY2. The function of ADCY2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM120. Collagen, Type IV, Alpha 4 (COL4A4, Accession NM_000092) is another VGAM157 host target gene. COL4A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A4 BINDING SITE, designated SEQ ID:5552, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:2868.

[11137] Another function of VGAM157 is therefore inhibition of Collagen, Type IV, Alpha 4 (COL4A4, Accession NM_000092). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A4. Fyn-related Kinase (FRK, Accession NM_002031) is another VGAM157 host target gene. FRK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FRK BINDING SITE, designated SEQ

ID:7787, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:2868.

[11138] Another function of VGAM157 is therefore inhibition of Fyn-related Kinase (FRK, Accession NM_002031), a gene which binds pRb (RB1) during G1 and S phase and suppresses growth. Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRK. The function of FRK has been established by previous studies. Tyrosine kinases are either expressed cytoplasmically, such as SRC (CSK; 124095), or as transmembrane receptors, such as growth factor receptors. They are involved in signal transduction and the regulation of cellular proliferation and have been linked to tumorigenesis through overexpression or mutation. Anneren et al. (2000) showed that expression of Gtk, the rodent homolog of FRK, in a rat pheochromocytoma cell line used as a model for neuronal cell differentiation induced nerve growth factor (see OMIM Ref. No. 162030)-independent neurite outgrowth and Rap1 (OMIM Ref. No. 605061) activation, probably through activation of the CrkII (OMIM Ref. No. 164762)-C3G (GRF2; 600303) pathway.

- [11139] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [11140] Anneren, C.; Reedquist, K. A.; Bos, J. L.; Welsh, M. : GTK, a Src-related tyrosine kinase, induces nerve growth factor-independent neurite outgrowth in PC12 cells through activation of the Rap1 pathway: relationship to Shb tyrosine phosphorylation and elevated levels of focal adhesion kinase. *J. Biol. Chem.* 275: 29153–29161, 2000. ; and
- [11141] Cance, W. G.; Craven, R. J.; Bergman, M.; Xu, L.; Alitalo, K.; Liu, E. T. : Rak, a novel nuclear tyrosine kinase expressed in epithelial cells. *Cell Growth Differ.* 5: 1347–1355, 1994.
- [11142] Further studies establishing the function and utilities of FRK are found in John Hopkins OMIM database record ID 606573, and in cited publications numbered 6108–6112 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 2 (A1–5) (ZNF2, Accession NM_021088) is another VGAM157 host target gene. ZNF2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of ZNF2 BINDING SITE, designated SEQ ID:22067, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:2868.

[11143] Another function of VGAM157 is therefore inhibition of Zinc Finger Protein 2 (A1-5) (ZNF2, Accession NM_021088). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF2. DKFZP727G051 (Accession XM_045308) is another VGAM157 host target gene. DKFZP727G051 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP727G051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP727G051 BINDING SITE, designated SEQ ID:34428, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:2868.

[11144] Another function of VGAM157 is therefore inhibition of DKFZP727G051 (Accession XM_045308). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP727G051. Enabled Homolog (Drosophila) (ENAH, Accession NM_018212) is another VGAM157 host target gene. ENAH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENAH BINDING SITE, designated SEQ ID:20127, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:2868.

[11145] Another function of VGAM157 is therefore inhibition of Enabled Homolog (Drosophila) (ENAH, Accession NM_018212). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENAH. KIAA1237 (Accession XM_087386) is another VGAM157 host target gene. KIAA1237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1237 BINDING SITE, designated SEQ

ID:39218, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:2868.

[11146] Another function of VGAM157 is therefore inhibition of KIAA1237 (Accession XM_087386). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1237. Lymphoid-restricted Membrane Protein (LRMP, Accession NM_006152) is another VGAM157 host target gene. LRMP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LRMP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRMP BINDING SITE, designated SEQ ID:12807, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:2868.

[11147] Another function of VGAM157 is therefore inhibition of Lymphoid-restricted Membrane Protein (LRMP, Accession NM_006152). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRMP. MOST2 (Accession NM_020250) is another VGAM157 host target gene.

MOST2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MOST2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOST2 BINDING SITE, designated SEQ ID:21556, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:2868.

[11148] Another function of VGAM157 is therefore inhibition of MOST2 (Accession NM_020250). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOST2. Paralemmin (PALM, Accession NM_002579) is another VGAM157 host target gene. PALM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PALM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PALM BINDING SITE, designated SEQ ID:8441, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:2868.

[11149] Another function of VGAM157 is therefore inhibition of Paralemmin (PALM, Accession NM_002579). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PALM. LOC197285 (Accession XM_113752) is another VGAM157 host target gene. LOC197285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197285 BINDING SITE, designated SEQ ID:42415, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:2868.

[11150] Another function of VGAM157 is therefore inhibition of LOC197285 (Accession XM_113752). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197285. LOC92283 (Accession XM_044049) is another VGAM157 host target gene. LOC92283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92283, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92283 BINDING SITE, designated SEQ ID:34093, to the nucleotide sequence of VGAM157 RNA, herein designated VGAM RNA, also designated SEQ ID:2868.

[11151] Another function of VGAM157 is therefore inhibition of LOC92283 (Accession XM_044049). Accordingly, utilities of VGAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92283. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 158 (VGAM158) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11152] VGAM158 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM158 was detected is described hereinabove with reference to Figs. 1–8.

[11153] VGAM158 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM158 host

target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11154] VGAM158 gene encodes a VGAM158 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM158 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM158 precursor RNA is designated SEQ ID:144, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:144 is located at position 216380 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11155] VGAM158 precursor RNA folds onto itself, forming VGAM158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11156] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM158 folded precursor RNA into VGAM158 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM158 RNA is designated SEQ ID:2869, and is provided hereinbelow with reference to the sequence listing part.

[11157] VGAM158 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM158 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM158 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11158] VGAM158 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM158 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM158 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM158 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM158 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11159] The complementary binding of VGAM158 RNA, herein designated VGAM RNA, to host target binding sites on VGAM158 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM158 host target RNA into VGAM158 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11160] It is appreciated that VGAM158 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM158 host target genes. The mRNA of each one of this plurality of VGAM158 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM158 RNA, herein designated VGAM RNA, and which when bound by VGAM158 RNA causes inhibition of translation of respective one or more VGAM158 host target proteins.

[11161] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM158 gene, herein designated VGAM GENE, on one or more VGAM158 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11162] It is yet further appreciated that a function of VGAM158 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM158 correlate with, and may be deduced from, the identity of the host target genes which VGAM158 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11163] Nucleotide sequences of the VGAM158 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM158 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM158 are further

described hereinbelow with reference to Table 1.

[11164] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM158 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM158 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11165] As mentioned hereinabove with reference to Fig. 1, a function of VGAM158 gene, herein designated VGAM is inhibition of expression of VGAM158 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM158 correlate with, and may be deduced from, the identity of the target genes which VGAM158 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11166] HERV-H LTR-associating 1 (HHLA1, Accession NM_005712) is a VGAM158 host target gene. HHLA1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HHLA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of HHLA1 BINDING SITE, designated SEQ ID:12265, to the nucleotide sequence of VGAM158 RNA, herein designated VGAM RNA, also designated SEQ ID:2869.

[11167] A function of VGAM158 is therefore inhibition of HERV-H LTR-associating 1 (HHLA1, Accession NM_005712), a gene which has unknown function and with low similarity to a region of *S. cerevisiae* WSC4. Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HHLA1. The function of HHLA1 has been established by previous studies. Human endogenous retroviruses (HERVs) are repetitive elements, derived from ancient germline retroviral infections, that have increased in copy number by further rounds of infection, retrotransposition, and/or duplication. The HERV-H family has been shown to play a role in the expression of a variety of adjacent genes. For example, Feuchter-Murthy et al. (1993) isolated a teratocarcinoma cell line transcript, PLA2L (phospholipase A2-like), which initiates in the long terminal repeat (LTR) of an HERV-H element present in an intron and splices into downstream exons. They found that the teratocarcinoma cells contained additional, alternatively spliced PLA2L mRNAs, designated AF6 through -8, which lack the

coding regions for the phospholipase A2 (PLA2)–like domains. Kowalski et al. (1999) determined that PLA2L is a tripartite fusion transcript expressed from the HERV–H element's promoter and containing exons from a novel gene, HHLA1, and from OC90 (OMIM Ref. No. 601658), a gene encoding an inner ear protein with PLA2 domains. The coding regions of the AF6, –7, and –8 mRNAs are derived only from the HHLA1 gene and encode a predicted 305–amino acid protein. The authors hypothesized that the human HHLA1 and OC90 genes are normally expressed independently from different promoters, and that the intergenic splicing event that generates PLA2L is specific to teratocarcinoma cells. The HERV–H element is located within an intron of HHLA1 and the OC90 gene is located less than 10 kb downstream of HHLA1. Kowalski et al. (1997) determined that the HERV–H element at this locus integrated 15 to 20 million years ago since it is present in chimpanzee and gorilla but absent in orangutan and lower primates. They mapped the HHLA1 locus to 8q24.

[11168] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11169] Kowalski, P. E.; Freeman, J. D.; Mager, D. L. : Intergenic splicing between a HERV-H endogenous retrovirus and two adjacent human genes. *Genomics* 57: 371–379, 1999.
; and

[11170] Kowalski, P. E.; Freeman, J. D.; Nelson, D. T.; Mager, D. L. : Genomic structure and evolution of a novel gene (PLA2L) with duplicated phospholipase A2-like domains. *Genomics* 39: 38–46.

[11171] Further studies establishing the function and utilities of HHLA1 are found in John Hopkins OMIM database record ID 604109, and in cited publications numbered 6211–621 and 7061 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ13657 (Accession NM_024828) is another VGAM158 host target gene. FLJ13657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13657 BINDING SITE, designated SEQ ID:24221, to the nucleotide sequence of VGAM158 RNA, herein designated VGAM RNA, also designated SEQ ID:2869.

[11172] Another function of VGAM158 is therefore inhibition of FLJ13657 (Accession NM_024828). Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13657. LOC158629 (Accession XM_098972) is another VGAM158 host target gene. LOC158629 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158629, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158629 BINDING SITE, designated SEQ ID:42019, to the nucleotide sequence of VGAM158 RNA, herein designated VGAM RNA, also designated SEQ ID:2869.

[11173] Another function of VGAM158 is therefore inhibition of LOC158629 (Accession XM_098972). Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158629. LOC169436 (Accession XM_095696) is another VGAM158 host target gene. LOC169436 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169436, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169436 BINDING SITE, designated SEQ ID:40276, to the nucleotide sequence of VGAM158 RNA, herein designated VGAM RNA, also designated SEQ ID:2869.

[11174] Another function of VGAM158 is therefore inhibition of LOC169436 (Accession XM_095696). Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169436. LOC255098 (Accession XM_170912) is another VGAM158 host target gene. LOC255098 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255098, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255098 BINDING SITE, designated SEQ ID:45688, to the nucleotide sequence of VGAM158 RNA, herein designated VGAM RNA, also designated SEQ ID:2869.

[11175] Another function of VGAM158 is therefore inhibition of LOC255098 (Accession XM_170912). Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC255098. LOC96597 (Accession XM_039922) is another VGAM158 host target gene. LOC96597 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC96597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC96597 BINDING SITE, designated SEQ ID:33229, to the nucleotide sequence of VGAM158 RNA, herein designated VGAM RNA, also designated SEQ ID:2869.

[11176] Another function of VGAM158 is therefore inhibition of LOC96597 (Accession XM_039922). Accordingly, utilities of VGAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC96597. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 159 (VGAM159) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11177] VGAM159 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM159 was detected is described hereinabove with reference to Figs. 1–8.

[11178] VGAM159 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM159 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11179] VGAM159 gene encodes a VGAM159 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM159 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM159 precursor RNA is designated SEQ ID:145, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:145 is located at position 40934 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11180] VGAM159 precursor RNA folds onto itself, forming VGAM159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11181] An enzyme complex designated DICER COMPLEX, `dices` the VGAM159 folded precursor RNA into VGAM159 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide sequence of VGAM159 RNA is designated SEQ ID:2870, and is provided hereinbelow with reference to the sequence listing part.

[11182] VGAM159 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM159 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM159 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11183] VGAM159 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM159 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM159 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM159 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM159 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11184] The complementary binding of VGAM159 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM159 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM159 host target RNA into VGAM159 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11185] It is appreciated that VGAM159 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM159 host target genes. The mRNA of each one of this plurality of VGAM159 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM159 RNA, herein designated VGAM RNA, and which when bound by VGAM159 RNA causes inhibition of translation of respective one or more VGAM159 host target proteins.

[11186] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM159 gene, herein designated VGAM GENE, on one or more VGAM159 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11187] It is yet further appreciated that a function of VGAM159 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM159 correlate with, and may be deduced from, the identity of the host target genes which VGAM159 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11188] Nucleotide sequences of the VGAM159 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM159 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM159 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM159 are further
described hereinbelow with reference to Table 1.

[11189] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM159 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM159 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[11190] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM159 gene, herein designated VGAM is
inhibition of expression of VGAM159 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM159 correlate with, and may be deduced
from, the identity of the target genes which VGAM159
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[11191] Cyclin T2 (CCNT2, Accession NM_058241) is a VGAM159
host target gene. CCNT2 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by CCNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNT2 BINDING SITE, designated SEQ ID:27768, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:2870.

[11192] A function of VGAM159 is therefore inhibition of Cyclin T2 (CCNT2, Accession NM_058241), a gene which is a regulatory subunit of the cyclin-dependent kinase pair (cdk9/cyclin t) complex. Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNT2. The function of CCNT2 has been established by previous studies. Positive transcription elongation factor b (OMIM Ref. No. P-TEFb) is thought to facilitate the transition from abortive to productive elongation by phosphorylating the C-terminal domain (CTD) of the largest subunit of RNA polymerase II (POLR2A; 180660). Drosophila P-TEFb is composed of CDK9 (OMIM Ref. No. 603251) and cyclin T. By searching an EST database for homologs of Drosophila cyclin T, Peng et al. (1998) identified cDNAs encoding hu-

man cyclins T1 (OMIM Ref. No. 602506) and T2. Alternative splicing of the primary T2 transcript results in 2 isoforms termed T2a and T2b. The predicted 663-amino acid T2a and 730-amino acid T2b isoforms have different C-termini. Within the conserved N-terminal cyclin box region, cyclin T2 shares 64% and 81% identity with *Drosophila* cyclin T and human cyclin T1, respectively. Immunoprecipitation studies demonstrated that CDK9 is complexed with the cyclins T1 and T2 in HeLa cell nuclear extracts. Approximately 80% of CDK9 is complexed with cyclin T1, 10% with cyclin T2a and 10% with T2b. Each complex is an active P-TEFb molecule that can phosphorylate the CTD of RNA polymerase II and cause the transition from abortive elongation into productive elongation. When expressed in mammalian cells, all 3 CDK9/cyclin T combinations strongly activated a CMV promoter. Northern blot analysis revealed that cyclin T2 was expressed as multiple mRNAs in all human tissues tested. Yang et al. (2001) identified 7SK snRNA (OMIM Ref. No. 606515) as a specific P-TEFb-associated factor. 7SK inhibits general and HIV-1 Tat-specific transcriptional activities of P-TEFb in vivo and in vitro by inhibiting the kinase activity of CDK9 and preventing recruitment of P-TEFb to the HIV-1

promoter. 7SK is efficiently dissociated from P-TEFb (the CDK9/cyclin T1 heterodimer) by treatment of cells with ultraviolet irradiation and actinomycin D. As these 2 agents have been shown to enhance significantly HIV-1 transcription and phosphorylation of Pol-II, Yang et al. (2001) concluded that their data provide a mechanistic explanation for this stimulatory effect. Yang et al. (2001) further suggested that the 7SK/P-TEFb interaction may serve as a principal control point for the induction of cellular and HIV-1 viral gene expression during stress-related responses. The study demonstrated the involvement of an snRNA in controlling the activity of CDK/cyclin kinase.

[11193] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11194] Peng, J.; Zhu, Y.; Milton, J. T.; Price, D. H. : Identification of multiple cyclin subunits of human P-TEFb. *Genes Dev.* 12: 755-762, 1998. ; and

[11195] Yang, Z.; Zhu, Q.; Luo, K.; Zhou, Q. : The 7SK small nuclear RNA inhibits the CDK9/cyclin T1 kinase to control transcription. *Nature* 414: 317-322, 2001.

[11196] Further studies establishing the function and utilities of

CCNT2 are found in John Hopkins OMIM database record ID 603862, and in cited publications numbered 9033–9035 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662) is another VGAM159 host target gene. DISC1 BINDING SITE1 and DISC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DISC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DISC1 BINDING SITE1 and DISC1 BINDING SITE2, designated SEQ ID:20732 and SEQ ID:20733 respectively, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:2870.

[11197] Another function of VGAM159 is therefore inhibition of Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662), a gene which has globular N-terminal domain(s) and a helical C-terminal domain. Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DISC1. The function of DISC1 and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.GRP3 (Accession NM_015376) is another VGAM159 host target gene. GRP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRP3 BINDING SITE, designated SEQ ID:17673, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:2870.

[11198] Another function of VGAM159 is therefore inhibition of GRP3 (Accession NM_015376). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRP3. KIAA0205 (Accession NM_014873) is another VGAM159 host target gene. KIAA0205 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0205 BINDING SITE,

designated SEQ ID:17001, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:2870.

[11199] Another function of VGAM159 is therefore inhibition of KIAA0205 (Accession NM_014873). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0205. KIAA1237 (Accession XM_087386) is another VGAM159 host target gene. KIAA1237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1237 BINDING SITE, designated SEQ ID:39215, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:2870.

[11200] Another function of VGAM159 is therefore inhibition of KIAA1237 (Accession XM_087386). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1237. KIAA1789 (Accession XM_040486) is another VGAM159 host target gene. KIAA1789 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1789 BINDING SITE, designated SEQ ID:33306, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:2870.

[11201] Another function of VGAM159 is therefore inhibition of KIAA1789 (Accession XM_040486). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1789. PA26 (Accession NM_014454) is another VGAM159 host target gene. PA26 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PA26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PA26 BINDING SITE, designated SEQ ID:15806, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:2870.

[11202] Another function of VGAM159 is therefore inhibition of

PA26 (Accession NM_014454). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PA26. PHD Finger Protein 5A (PHF5A, Accession NM_032758) is another VGAM159 host target gene. PHF5A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHF5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHF5A BINDING SITE, designated SEQ ID:26501, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:2870.

[11203] Another function of VGAM159 is therefore inhibition of PHD Finger Protein 5A (PHF5A, Accession NM_032758). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHF5A. LOC126603 (Accession XM_060090) is another VGAM159 host target gene. LOC126603 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC126603, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126603 BINDING SITE, designated SEQ ID:37151, to the nucleotide sequence of VGAM159 RNA, herein designated VGAM RNA, also designated SEQ ID:2870.

[11204] Another function of VGAM159 is therefore inhibition of LOC126603 (Accession XM_060090). Accordingly, utilities of VGAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126603. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 160 (VGAM160) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11205] VGAM160 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM160 was detected is described hereinabove with reference to Figs. 1–8.

[11206] VGAM160 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM160 host

target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11207] VGAM160 gene encodes a VGAM160 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM160 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM160 precursor RNA is designated SEQ ID:146, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:146 is located at position 76536 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11208] VGAM160 precursor RNA folds onto itself, forming VGAM160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11209] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM160 folded precursor RNA into VGAM160 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM160 RNA is designated SEQ ID:2871, and is provided hereinbelow with reference to the sequence listing part.

[11210] VGAM160 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM160 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM160 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11211] VGAM160 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM160 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM160 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM160 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM160 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11212] The complementary binding of VGAM160 RNA, herein designated VGAM RNA, to host target binding sites on VGAM160 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM160 host target RNA into VGAM160 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11213] It is appreciated that VGAM160 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM160 host target genes. The mRNA of each one of this plurality of VGAM160 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM160 RNA, herein designated VGAM RNA, and which when bound by VGAM160 RNA causes inhibition of translation of respective one or more VGAM160 host target proteins.

[11214] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM160 gene, herein designated VGAM GENE, on one or more VGAM160 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11215] It is yet further appreciated that a function of VGAM160 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM160 correlate with, and may be deduced from, the identity of the host target genes which VGAM160 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11216] Nucleotide sequences of the VGAM160 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM160 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM160 are further

described hereinbelow with reference to Table 1.

[11217] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM160 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM160 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11218] As mentioned hereinabove with reference to Fig. 1, a function of VGAM160 gene, herein designated VGAM is inhibition of expression of VGAM160 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM160 correlate with, and may be deduced from, the identity of the target genes which VGAM160 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11219] Collagen, Type IV, Alpha 6 (COL4A6, Accession NM_033641) is a VGAM160 host target gene. COL4A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL4A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of COL4A6 BINDING SITE, designated SEQ ID:27356, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:2871.

[11220] A function of VGAM160 is therefore inhibition of Collagen, Type IV, Alpha 6 (COL4A6, Accession NM_033641). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A6. FLJ14566 (Accession NM_032806) is another VGAM160 host target gene. FLJ14566 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14566 BINDING SITE, designated SEQ ID:26563, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:2871.

[11221] Another function of VGAM160 is therefore inhibition of FLJ14566 (Accession NM_032806). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14566. LOC143153 (Accession XM_084440) is another VGAM160

host target gene. LOC143153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143153 BINDING SITE, designated SEQ ID:37578, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:2871.

[11222] Another function of VGAM160 is therefore inhibition of LOC143153 (Accession XM_084440). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143153. LOC143154 (Accession XM_084441) is another VGAM160 host target gene. LOC143154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143154 BINDING SITE, designated SEQ ID:37585, to the nucleotide sequence of VGAM160 RNA, herein designated VGAM RNA, also designated SEQ ID:2871.

[11223] Another function of VGAM160 is therefore inhibition of LOC143154 (Accession XM_084441). Accordingly, utilities of VGAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143154. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 161 (VGAM161) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11224] VGAM161 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM161 was detected is described hereinabove with reference to Figs. 1–8.

[11225] VGAM161 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM161 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11226] VGAM161 gene encodes a VGAM161 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM161 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM161 precursor RNA is designated SEQ ID:147, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:147 is located at position 96172 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11227] VGAM161 precursor RNA folds onto itself, forming VGAM161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11228] An enzyme complex designated DICER COMPLEX, `dices` the VGAM161 folded precursor RNA into VGAM161 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM161 RNA is designated SEQ ID:2872, and is provided hereinbelow with reference to the sequence listing part.

[11229] VGAM161 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM161 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM161 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11230] VGAM161 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM161 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM161 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM161 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM161 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11231] The complementary binding of VGAM161 RNA, herein designated VGAM RNA, to host target binding sites on VGAM161 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM161 host target RNA into VGAM161 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11232] It is appreciated that VGAM161 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM161 host target genes. The mRNA of each one of this plurality of VGAM161 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM161 RNA, herein designated VGAM RNA, and which when bound by VGAM161 RNA causes inhibition of translation of respective one or more VGAM161 host target proteins.

[11233] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM161 gene, herein designated VGAM GENE, on one or more VGAM161 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11234] It is yet further appreciated that a function of VGAM161 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM161 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM161 correlate with, and may be deduced from, the identity of the host target genes which VGAM161 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11235] Nucleotide sequences of the VGAM161 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM161 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM161 are further described hereinbelow with reference to Table 1.

[11236] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM161 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM161 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11237] As mentioned hereinabove with reference to Fig. 1, a function of VGAM161 gene, herein designated VGAM is inhibition of expression of VGAM161 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM161 correlate with, and may be deduced from, the identity of the target genes which VGAM161 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11238] FLJ10579 (Accession NM_018145) is a VGAM161 host target gene. FLJ10579 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10579, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10579 BINDING SITE, designated SEQ ID:19945, to the nucleotide sequence of VGAM161 RNA, herein designated VGAM RNA, also designated SEQ ID:2872.

[11239] A function of VGAM161 is therefore inhibition of FLJ10579 (Accession NM_018145). Accordingly, utilities of VGAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10579. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 162 (VGAM162) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11240] VGAM162 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM162 was detected is described hereinabove with reference to Figs. 1–8.

[11241] VGAM162 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM162 host

target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11242] VGAM162 gene encodes a VGAM162 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM162 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM162 precursor RNA is designated SEQ ID:148, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:148 is located at position 173989 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11243] VGAM162 precursor RNA folds onto itself, forming VGAM162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11244] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM162 folded precursor RNA into VGAM162 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM162 RNA is designated SEQ ID:2873, and is provided hereinbelow with reference to the sequence listing part.

[11245] VGAM162 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM162 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM162 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11246] VGAM162 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM162 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM162 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM162 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM162 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[11247] The complementary binding of VGAM162 RNA, herein designated VGAM RNA, to host target binding sites on VGAM162 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM162 host target RNA into VGAM162 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11248] It is appreciated that VGAM162 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM162 host target genes. The mRNA of each one of this plurality of VGAM162 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM162 RNA, herein designated VGAM RNA, and which when bound by VGAM162 RNA causes inhibition of translation of respective one or more VGAM162 host target proteins.

[11249] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM162 gene, herein designated VGAM GENE, on one or more VGAM162 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11250] It is yet further appreciated that a function of VGAM162 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM162 correlate with, and may be deduced from, the identity of the host target genes which VGAM162 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11251] Nucleotide sequences of the VGAM162 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM162 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM162 are further

described hereinbelow with reference to Table 1.

[11252] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM162 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM162 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11253] As mentioned hereinabove with reference to Fig. 1, a function of VGAM162 gene, herein designated VGAM is inhibition of expression of VGAM162 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM162 correlate with, and may be deduced from, the identity of the target genes which VGAM162 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11254] Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM_003679) is a VGAM162 host target gene. KMO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KMO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KMO BINDING SITE, designated SEQ ID:9779, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:2873.

[11255] A function of VGAM162 is therefore inhibition of Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM_003679), a gene which may play a role in encephalic photoreception. Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KMO. The function of KMO has been established by previous studies. Kynurenine 3-monooxygenase (KMO; EC 1.14.13.9) is an NADPH-dependent flavin monooxygenase that catalyzes the hydroxylation of the L-tryptophan metabolite L-kynurenine to form L-3-hydroxykynurenine. By screening a human liver cDNA library with a partial *Drosophila* KMO cDNA, Alberati-Giani et al. (1997) isolated cDNAs encoding human KMO. The predicted 486-amino acid human protein shares 47% sequence identity with *Drosophila* KMO. When expressed in mammalian cells, recombinant human KMO exhibited kinetic properties similar to those of the native human protein. Northern blot analysis revealed that human KMO is expressed as an approximately

2-kb mRNA in liver and placenta, and at lower levels in kidney. By comparing genomic and cDNA sequences, Halford et al. (2001) determined that the KMO gene contains at least 15 exons spanning approximately 68 kb. By genomic sequence analysis, Halford et al. (2001) determined that the KMO gene overlaps with the OPN3 gene (OMIM Ref. No. 606695) on chromosome 1q43 and that the 2 genes are transcribed from opposite strands.

[11256] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11257] Alberati-Giani, D.; Cesura, A. M.; Broger, C.; Warren, W. D.; Rover, S.; Malherbe, P. : Cloning and functional expression of human kynurenine 3-monooxygenase. FEBS Lett. 410: 407-412, 1997. ; and

[11258] Halford, S.; Freedman, M. S.; Bellingham, J.; Inglis, S. L.; Poopalasundaram, S.; Soni, B. G.; Foster, R. G.; Hunt, D. M. : Characterization of a novel human opsin gene with wide tissue.

[11259] Further studies establishing the function and utilities of KMO are found in John Hopkins OMIM database record ID 603538, and in cited publications numbered 507 and 12220 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM_006283) is another VGAM162 host target gene. TACC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TACC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACC1 BINDING SITE, designated SEQ ID:12962, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:2873.

[11260] Another function of VGAM162 is therefore inhibition of Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM_006283). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACC1. FENS-1 (Accession NM_020830) is another VGAM162 host target gene. FENS-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FENS-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of FENS-1 BINDING SITE, designated SEQ ID:21890, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:2873.

[11261] Another function of VGAM162 is therefore inhibition of FENS-1 (Accession NM_020830). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FENS-1. FLJ10506 (Accession NM_018117) is another VGAM162 host target gene. FLJ10506 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10506 BINDING SITE, designated SEQ ID:19888, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:2873.

[11262] Another function of VGAM162 is therefore inhibition of FLJ10506 (Accession NM_018117). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10506. KIAA1954 (Accession XM_085375) is another VGAM162

host target gene. KIAA1954 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1954 BINDING SITE, designated SEQ ID:38091, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:2873.

[11263] Another function of VGAM162 is therefore inhibition of KIAA1954 (Accession XM_085375). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1954. MGC32104 (Accession NM_144684) is another VGAM162 host target gene. MGC32104 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC32104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32104 BINDING SITE, designated SEQ ID:29502, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:2873.

[11264] Another function of VGAM162 is therefore inhibition of MGC32104 (Accession NM_144684). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32104. R3H Domain (binds single-stranded nucleic acids) Containing (R3HDM, Accession NM_015361) is another VGAM162 host target gene. R3HDM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by R3HDM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of R3HDM BINDING SITE, designated SEQ ID:17660, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:2873.

[11265] Another function of VGAM162 is therefore inhibition of R3H Domain (binds single-stranded nucleic acids) Containing (R3HDM, Accession NM_015361). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with R3HDM. LOC122509 (Accession NM_145249) is another VGAM162 host target gene. LOC122509 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC122509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122509 BINDING SITE, designated SEQ ID:29760, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:2873.

[11266] Another function of VGAM162 is therefore inhibition of LOC122509 (Accession NM_145249). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122509. LOC146138 (Accession XM_096938) is another VGAM162 host target gene. LOC146138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146138 BINDING SITE, designated SEQ ID:40658, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:2873.

[11267] Another function of VGAM162 is therefore inhibition of LOC146138 (Accession XM_096938). Accordingly, utilities

of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146138. LOC199958 (Accession XM_117163) is another VGAM162 host target gene. LOC199958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199958 BINDING SITE, designated SEQ ID:43265, to the nucleotide sequence of VGAM162 RNA, herein designated VGAM RNA, also designated SEQ ID:2873.

[11268] Another function of VGAM162 is therefore inhibition of LOC199958 (Accession XM_117163). Accordingly, utilities of VGAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199958. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 163 (VGAM163) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11269] VGAM163 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM163 was detected is described hereinabove with reference to Figs. 1–8.

[11270] VGAM163 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM163 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11271] VGAM163 gene encodes a VGAM163 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM163 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM163 precursor RNA is designated SEQ ID:149, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:149 is located at position 110896 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11272] VGAM163 precursor RNA folds onto itself, forming VGAM163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[11273] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM163 folded precursor RNA into VGAM163 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 41%) nucleotide se-
quence of VGAM163 RNA is designated SEQ ID:2874, and
is provided hereinbelow with reference to the sequence
listing part.

[11274] VGAM163 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM163 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM163 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[11275] VGAM163 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM163 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM163 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM163 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM163 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[11276] The complementary binding of VGAM163 RNA, herein designated VGAM RNA, to host target binding sites on VGAM163 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM163 host target RNA into VGAM163 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11277] It is appreciated that VGAM163 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM163 host target genes. The mRNA of each one of this plurality of VGAM163 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM163 RNA, herein designated VGAM RNA, and which when bound by VGAM163 RNA causes inhibition of translation of respective one or more VGAM163 host target proteins.

[11278] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM163 gene, herein designated VGAM GENE, on one or

more VGAM163 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11279] It is yet further appreciated that a function of VGAM163 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM163 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM163 correlate with, and may be deduced from, the identity of the host target genes which VGAM163 binds and inhibits, and the function of these host target genes, as elaborated herein-

below.

- [11280] Nucleotide sequences of the VGAM163 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM163 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM163 are further described hereinbelow with reference to Table 1.
- [11281] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM163 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM163 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [11282] As mentioned hereinabove with reference to Fig. 1, a function of VGAM163 gene, herein designated VGAM is inhibition of expression of VGAM163 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM163 correlate with, and may be deduced from, the identity of the target genes which VGAM163 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11283] ADP-ribosylation Factor 1 (ARF1, Accession XM_047545) is a VGAM163 host target gene. ARF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARF1 BINDING SITE, designated SEQ ID:34992, to the nucleotide sequence of VGAM163 RNA, herein designated VGAM RNA, also designated SEQ ID:2874.

[11284] A function of VGAM163 is therefore inhibition of ADP-ribosylation Factor 1 (ARF1, Accession XM_047545). Accordingly, utilities of VGAM163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF1. LOC155438 (Accession XM_098722) is another VGAM163 host target gene. LOC155438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155438 BINDING SITE, designated SEQ ID:41767, to the nucleotide sequence of VGAM163 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2874.

[11285] Another function of VGAM163 is therefore inhibition of LOC155438 (Accession XM_098722). Accordingly, utilities of VGAM163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155438. LOC56891 (Accession NM_020129) is another VGAM163 host target gene. LOC56891 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC56891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56891 BINDING SITE, designated SEQ ID:21323, to the nucleotide sequence of VGAM163 RNA, herein designated VGAM RNA, also designated SEQ ID:2874.

[11286] Another function of VGAM163 is therefore inhibition of LOC56891 (Accession NM_020129). Accordingly, utilities of VGAM163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56891. LOC89919 (Accession XM_027244) is another VGAM163 host target gene. LOC89919 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC89919, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89919 BINDING SITE, designated SEQ ID:30467, to the nucleotide sequence of VGAM163 RNA, herein designated VGAM RNA, also designated SEQ ID:2874.

[11287] Another function of VGAM163 is therefore inhibition of LOC89919 (Accession XM_027244). Accordingly, utilities of VGAM163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89919. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 164 (VGAM164) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11288] VGAM164 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM164 was detected is described hereinabove with reference to Figs. 1–8.

[11289] VGAM164 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syn–

drome Virus (white spot bacilliform virus). VGAM164 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11290] VGAM164 gene encodes a VGAM164 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM164 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM164 precursor RNA is designated SEQ ID:150, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:150 is located at position 35494 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11291] VGAM164 precursor RNA folds onto itself, forming VGAM164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11292] An enzyme complex designated DICER COMPLEX, `dices` the VGAM164 folded precursor RNA into VGAM164 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM164 RNA is designated SEQ ID:2875, and is provided hereinbelow with reference to the sequence listing part.

[11293] VGAM164 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM164 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM164 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11294] VGAM164 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM164 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM164 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM164 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM164 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11295] The complementary binding of VGAM164 RNA, herein designated VGAM RNA, to host target binding sites on VGAM164 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM164 host tar-

get RNA into VGAM164 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11296] It is appreciated that VGAM164 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM164 host target genes. The mRNA of each one of this plurality of VGAM164 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM164 RNA, herein designated VGAM RNA, and which when bound by VGAM164 RNA causes inhibition of translation of respective one or more VGAM164 host target proteins.

[11297] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM164 gene, herein designated VGAM GENE, on one or more VGAM164 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11298] It is yet further appreciated that a function of VGAM164 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM164 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM164 correlate with, and may be deduced from, the identity of the host target genes which VGAM164 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11299] Nucleotide sequences of the VGAM164 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM164 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM164 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM164 are further described hereinbelow with reference to Table 1.

[11300] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM164 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM164 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11301] As mentioned hereinabove with reference to Fig. 1, a function of VGAM164 gene, herein designated VGAM is inhibition of expression of VGAM164 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM164 correlate with, and may be deduced from, the identity of the target genes which VGAM164 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11302] Cyclin D2 (CCND2, Accession NM_001759) is a VGAM164 host target gene. CCND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of CCND2 BINDING SITE, designated SEQ ID:7521, to the nucleotide sequence of VGAM164 RNA, herein designated VGAM RNA, also designated SEQ ID:2875.

[11303] A function of VGAM164 is therefore inhibition of Cyclin D2 (CCND2, Accession NM_001759), a gene which is essential for the control of the cell cycle at the g1/s (start) transition. Accordingly, utilities of VGAM164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND2. The function of CCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128.EphA3 (EPHA3, Accession NM_005233) is another VGAM164 host target gene. EPHA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA3 BINDING SITE, designated SEQ ID:11740, to the nucleotide sequence of VGAM164 RNA, herein designated VGAM RNA, also designated SEQ ID:2875.

[11304] Another function of VGAM164 is therefore inhibition of EphA3 (EPHA3, Accession NM_005233), a gene which binds to ephrin-a2, -a3, -a4 and -a5. could play a role in lymphoid function. Accordingly, utilities of VGAM164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA3. The function of EPHA3 has been established by previous studies. See EPH (EPHA1; 179610) for background on Eph receptors and their ligands, the ephrins. Kinases that phosphorylate proteins on tyrosine residues (protein tyrosine kinases; PTKs) form a structurally related group of molecules that exhibit functional diversity. Genetic alterations that lead to the inappropriate activation or expression of PTKs may be oncogenic. Many growth factor receptors are PTKs, e.g., the receptors for epidermal growth factor (EGFR; 131550), platelet-derived growth factor (PDGFR1, 173410; PDGFR2, 173490), colony-stimulating factor-1 (CSF1R; 164770), and stem cell growth factor (OMIM Ref. No. 164920). Wicks et al. (1992) isolated and sequenced a 4.5-kb cDNA encoding the HEK receptor tyrosine kinase. Sequence comparison with other PTKs showed a high degree of homology with members of the EPH and ELK (EPHB1; 600600) families of receptor tyrosine kinases.

There was an apparent restriction of HEK expression to lymphoid tumor cell lines, raising the possibility that HEK may play a role in some human lymphoid malignancies and also in normal lymphoid function and differentiation. By purifying the protein from a pre-B acute lymphoblastic leukemia cell line and amino acid sequencing, Boyd et al. (1992) identified this molecule as a member of the eph/elk family of tyrosine kinases. They assigned this molecule the provisional name HEK, for human eph/elk-like kinase. By Southern blot analysis of somatic cell hybrids and fluorescence in situ hybridization, Wicks et al. (1994) localized the ETK gene to 3p11.2. Northern blotting by Fox et al. (1995) revealed that HEK4 is expressed as a single 7-kb transcript in a variety of human tissues, with the highest level of expression in placenta.

[11305] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11306] Wicks, I. P.; Wilkinson, D.; Salvaris, E.; Boyd, A. W. : Molecular cloning of HEK, the gene encoding a receptor tyrosine kinase expressed by human lymphoid tumor cell lines. Proc. Nat. Acad. Sci. 89: 1611-1615, 1992. ; and

[11307] Fox, G. M.; Holst, P. L.; Chute, H. T.; Lindberg, R. A.;

Janssen, A. M.; Basu, R.; Welcher, A. A. : cDNA cloning and tissue distribution of five human EPH-like receptor protein-tyrosine.

[11308] Further studies establishing the function and utilities of EPHA3 are found in John Hopkins OMIM database record ID 179611, and in cited publications numbered 12674-12677 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ubiquitin-conjugating Enzyme E2G 2 (UBC7 homolog, yeast) (UBE2G2, Accession XM_036087) is another VGAM164 host target gene. UBE2G2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2G2 BINDING SITE, designated SEQ ID:32377, to the nucleotide sequence of VGAM164 RNA, herein designated VGAM RNA, also designated SEQ ID:2875.

[11309] Another function of VGAM164 is therefore inhibition of Ubiquitin-conjugating Enzyme E2G 2 (UBC7 homolog, yeast) (UBE2G2, Accession XM_036087), a gene which catalyzes the covalent attachment of ubiquitin to other pro-

teins. Accordingly, utilities of VGAM164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2G2. The function of UBE2G2 has been established by previous studies. In eukaryotes, conjugation of target proteins to ubiquitin is an essential step in the proteasome-dependent degradation process and is mediated by a family of ubiquitin-conjugating (UBC) enzymes. See 600012. Katsanis and Fisher (1998) stated that *S. cerevisiae* Ubc7 is an endoplasmic reticulum-bound molecule whose active site faces the cytosol. Ubc7 has been shown to confer resistance to cadmium and to participate in the degradation of specific yeast proteins. As part of an effort to generate a transcriptional map of human chromosome 21, Katsanis and Fisher (1998) identified UBE2G2 cDNAs. The predicted 165-amino acid protein shares 60% sequence identity with yeast Ubc7. The nucleotide sequence of UBE2G2 is 57% similar to that of UBE2G (OMIM Ref. No. 601569), another human Ubc7 homolog. Northern blot analysis revealed that UBE2G2 is expressed ubiquitously as 2.9- and 7-kb mRNAs. The highest level of expression was seen in skeletal muscle. By inclusion within mapped clones and by analysis of somatic cell hybrid panels, Katsanis and Fisher (1998) mapped the

UBE2G2 gene to 21q22.3. Rose et al. (1998) confirmed the localization to 21q22.3 by FISH.

[11310] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11311] Katsanis, N.; Fisher, E. M. C. : Identification, expression, and chromosomal localization of ubiquitin conjugating enzyme 7 (UBE2G2), a human homologue of the *Saccharomyces cerevisiae* Ubc7 gene. *Genomics* 51: 128–131, 1998. ; and

[11312] Rose, S. A.; Leek, J. P.; Moynihan, T. P.; Ardley, H. C.; Markham, A. F.; Robinson, P. A. : Assignment of the ubiquitin conjugating enzyme gene, UBE2G2, to human chromosome band 21q22.3.

[11313] Further studies establishing the function and utilities of UBE2G2 are found in John Hopkins OMIM database record ID 603124, and in cited publications numbered 639–640 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP547E1010 (Accession NM_015607) is another VGAM164 host target gene. DKFZP547E1010 BINDING SITE1 and DKFZP547E1010 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

DKFZP547E1010, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP547E1010 BINDING SITE1 and DKFZP547E1010 BINDING SITE2, designated SEQ ID:17879 and SEQ ID:33243 respectively, to the nucleotide sequence of VGAM164 RNA, herein designated VGAM RNA, also designated SEQ ID:2875.

[11314] Another function of VGAM164 is therefore inhibition of DKFZP547E1010 (Accession NM_015607). Accordingly, utilities of VGAM164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP547E1010. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 165 (VGAM165) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11315] VGAM165 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM165 was detected is described hereinabove with reference to Figs. 1–8.

[11316] VGAM165 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM165 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11317] VGAM165 gene encodes a VGAM165 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM165 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM165 precursor RNA is designated SEQ ID:151, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:151 is located at position 293621 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11318] VGAM165 precursor RNA folds onto itself, forming VGAM165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11319] An enzyme complex designated DICER COMPLEX, `dices` the VGAM165 folded precursor RNA into VGAM165 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM165 RNA is designated SEQ ID:2876, and is provided hereinbelow with reference to the sequence listing part.

[11320] VGAM165 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM165 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM165 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11321] VGAM165 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM165 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM165 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM165 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM165 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11322] The complementary binding of VGAM165 RNA, herein designated VGAM RNA, to host target binding sites on VGAM165 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM165 host target RNA into VGAM165 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11323] It is appreciated that VGAM165 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM165 host target genes. The mRNA of each one of this plurality of VGAM165 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM165 RNA, herein designated VGAM RNA, and which when bound by VGAM165 RNA causes inhibition of translation of respective one or more VGAM165 host target proteins.

[11324] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM165 gene, herein designated VGAM GENE, on one or more VGAM165 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11325] It is yet further appreciated that a function of VGAM165 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM165 correlate with, and may be deduced from, the identity of the host target genes which VGAM165 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11326] Nucleotide sequences of the VGAM165 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM165 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM165 are further described hereinbelow with reference to Table 1.

[11327] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM165 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM165 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11328] As mentioned hereinabove with reference to Fig. 1, a function of VGAM165 gene, herein designated VGAM is inhibition of expression of VGAM165 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM165 correlate with, and may be deduced from, the identity of the target genes which VGAM165 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11329] Cell Division Cycle 25B (CDC25B, Accession NM_021873) is a VGAM165 host target gene. CDC25B BINDING SITE1 and CDC25B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

CDC25B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC25B BINDING SITE1 and CDC25B BINDING SITE2, designated SEQ ID:22411 and SEQ ID:22415 respectively, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:2876.

[11330] A function of VGAM165 is therefore inhibition of Cell Division Cycle 25B (CDC25B, Accession NM_021873), a gene which is positively activated by dephosphorylation. Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC25B. The function of CDC25B has been established by previous studies. Central to the onset of mitosis in all eukaryotic cells is the CDC2 protein kinase (CDK1; 116940), the activity of which is negatively regulated by phosphorylation and positively activated by dephosphorylation. The latter function is carried out by a specific phosphatase, CDC25. At least 3 human CDC25 genes code for the A, B, and C forms of CDC25. CDC25C (OMIM Ref. No. 157680) maps to chromosome 5. Lane et al. (1993) demonstrated by fluorescence in situ hybridiza-

tion that CDC25B maps to 20p13. PCR analysis of a monochromosomal hybrid cell panel yielded results supporting this chromosome assignment. Demetrick and Beach (1993) also mapped CDC25B to 20p13 by fluorescence in situ hybridization with confirmation by the polymerase chain reaction of hamster/human somatic cell hybrid DNA. Animal model experiments lend further support to the function of CDC25B. Lincoln et al. (2002) generated Cdc25b-deficient mice by targeted disruption and found that they were viable. As compared with wildtype cells, fibroblasts from Cdc25b $-/-$ mice grew vigorously in culture and arrested normally in response to DNA damage. Female Cdc25b $-/-$ mice were sterile and Cdc25b $-/-$ oocytes remained arrested at prophase with low maturation-promoting factor activity. Microinjection of wildtype Cdc25b mRNA into Cdc25b $-/-$ oocytes caused activation of maturation-promoting factor and resumption of meiosis. Thus, Lincoln et al. (2002) concluded that Cdc25b $-/-$ female mice were sterile because of permanent meiotic arrest resulting from the inability to activate the maturation-promoting factor component CDK1. Cdc25b is therefore essential for meiotic resumption in female mice. Lincoln et al. (2002) stated that mice lacking Cdc25b pro-

vided the first genetic model for studying the mechanisms regulating prophase arrest in vertebrates.

[11331] It is appreciated that the abovementioned animal model for CDC25B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[11332] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11333] Lane, S. A.; Baker, E.; Sutherland, G. R.; Tonks, I.; Hayward, N.; Ellem, K. : The human cell cycle gene CDC25B is located at 20p13. Genomics 15: 693–694, 1993. ; and

[11334] Lincoln, A. J.; Wickramasinghe, D.; Stein, P.; Schultz, R. M.; Palko, M. E.; De Miguel, M. P.; Tessarollo, L.; Donovan, P. J. : Cdc25b phosphatase is required for resumption of meiosis d.

[11335] Further studies establishing the function and utilities of CDC25B are found in John Hopkins OMIM database record ID 116949, and in cited publications numbered 296 and 1936–1937 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glucose–6–phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession

NM_000151) is another VGAM165 host target gene. G6PC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by G6PC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PC BINDING SITE, designated SEQ ID:5655, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:2876.

[11336] Another function of VGAM165 is therefore inhibition of Glucose-6-phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession NM_000151). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PC. Mannosyl (alpha-1,3)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT1, Accession NM_002406) is another VGAM165 host target gene. MGAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of MGAT1 BINDING SITE, designated SEQ ID:8225, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:2876.

[11337] Another function of VGAM165 is therefore inhibition of Mannosyl (alpha-1,3-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT1, Accession NM_002406), a gene which exists as a single protein-encoding exon. Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT1. The function of MGAT1 has been established by previous studies. There are believed to be over 100 different glycosyltransferases involved in the synthesis of protein-bound and lipid-bound oligosaccharides. One of these, UDP-N-acetylglucosamine:alpha-3-D-mannoside beta-1,2-N-acetylglucosaminyltransferase I (GlcNAc-T I; EC 2.4.1.101), is a medial-Golgi enzyme essential for the synthesis of hybrid and complex N-glycans. Kumar and Stanley (1989) identified the human gene encoding N-acetylglucosaminyltransferase I by complementation of the glycosylation defect in the Lec1 Chinese hamster ovary (CHO) cell mutant. Kumar et al. (1990) cloned the gene.

The overall features of the cDNA and deduced protein sequence (445 amino acids) were typical of other Golgi transferases that are type II transmembrane proteins. Hull et al. (1991) isolated 2 overlapping genomic DNA clones which span 18 kb containing the single 2.5-kb exon for GlcNAc-T I. The exon includes most of the 5-prime untranslated region, the complete coding sequence (1,335 bases, 445 amino acids), and the complete 3-prime untranslated region. Southern blot analysis indicated that the gene (symbolized GLCT1) exists in single copy in the human genome, and study of human-hamster somatic cell hybrids indicated that the gene is located on chromosome 5. Pownall et al. (1992) demonstrated that the sequence of the mouse gene *Mgat1* is highly conserved with respect to the human and rabbit homologs and exists as a single protein-encoding exon. They mapped the gene to mouse chromosome 11, closely linked to the gene encoding IL3 (OMIM Ref. No. 147740), by the analysis of multilocus interspecies backcrosses. Thus, the human gene may be in the same area as IL3, i.e., 5q23-q31. Kumar et al. (1992) mapped the gene to 5q31.2-q31.3 by in situ hybridization. Tan et al. (1995) reported that the MGAT1 gene maps to 5q35 by fluorescence in situ hybridization. They

considered the discrepancy with the findings of Kumar et al. (1992) to be due to greater precision of fluorescence analysis compared with radioactive in situ hybridization. Shows (1999) stated that by use of more sensitive FISH technology than that used in their 1992 report (Kumar et al., 1992), he and his colleagues confirmed the assignment of the MGAT1 gene to 5q35. On Northern blots, Yip et al. (1997) found that GlcNAc-T I is expressed as 2 mRNAs of 3.1 and 2.7 to 3.0 kb in all tissues tested, although only the 3.1-kb mRNA is seen in brain, and expression levels are low. Yip et al. (1997) also found that exon 1 of the GlcNAc-T I gene encodes the 5-prime untranslated region and contains multiple transcription start sites. Ioffe and Stanley (1994) produced transgenic mice lacking *Mgat1*. Homozygous mutant mice died between 9.5 and 10.5 days of development and were developmentally retarded, especially in neural tissue. Metzler et al. (1994) obtained similar results, finding that neural tube formation, vascularization, and left-right asymmetry formation were impaired in homozygous mutant mouse embryos.

[11338] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [11339] Tan, J.; D'Agostaro, G. A. F.; Bendiak, B.; Reck, F.; Sarkar, M.; Squire, J. A.; Leong, P.; Schachter, H. : The human UDP-N-acetylglucosamine:alpha-6-D-mannoside-beta-1,2-N-acetylglucosaminyltransferase II gene (MGAT2): cloning of genomic DNA, localization to chromosome 14q21, expression in insect cells and purification of the recombinant protein. *Europ. - [11341] Further studies establishing the function and utilities of MGAT1 are found in John Hopkins OMIM database record ID 160995, and in cited publications numbered 3807-381 and 3817 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0182 (Accession XM_050495) is another VGAM165 host target gene. KIAA0182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0182, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0182 BINDING SITE, designated SEQ ID:35643, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:2876.

[11342] Another function of VGAM165 is therefore inhibition of KIAA0182 (Accession XM_050495). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0182. KIAA1061 (Accession XM_048786) is another VGAM165 host target gene. KIAA1061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1061 BINDING SITE, designated SEQ ID:35267, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:2876.

[11343] Another function of VGAM165 is therefore inhibition of KIAA1061 (Accession XM_048786). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1061. Phytanoyl-CoA Hydroxylase Interacting Protein (PHYHIP, Accession NM_014759) is another VGAM165 host target gene. PHYHIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHYHIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHYHIP BINDING SITE, designated SEQ ID:16511, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:2876.

[11344] Another function of VGAM165 is therefore inhibition of Phytanoyl-CoA Hydroxylase Interacting Protein (PHYHIP, Accession NM_014759). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHYHIP.

STRAIT11499 (Accession NM_021242) is another VGAM165 host target gene. STRAIT11499 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STRAIT11499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

STRAIT11499 BINDING SITE, designated SEQ ID:22211, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:2876.

[11345] Another function of VGAM165 is therefore inhibition of STRAIT11499 (Accession NM_021242). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRAIT11499. LOC157753 (Accession XM_088381) is another VGAM165 host target gene. LOC157753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157753 BINDING SITE, designated SEQ ID:39662, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:2876.

[11346] Another function of VGAM165 is therefore inhibition of LOC157753 (Accession XM_088381). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157753. LOC253070 (Accession XM_173088) is another VGAM165 host target gene. LOC253070 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253070 BINDING SITE, designated SEQ ID:46355, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:2876.

[11347] Another function of VGAM165 is therefore inhibition of LOC253070 (Accession XM_173088). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253070. LOC257479 (Accession XM_171548) is another VGAM165 host target gene. LOC257479 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257479 BINDING SITE, designated SEQ ID:46050, to the nucleotide sequence of VGAM165 RNA, herein designated VGAM RNA, also designated SEQ ID:2876.

[11348] Another function of VGAM165 is therefore inhibition of

LOC257479 (Accession XM_171548). Accordingly, utilities of VGAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257479. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 166 (VGAM166) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11349] VGAM166 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM166 was detected is described hereinabove with reference to Figs. 1–8.

[11350] VGAM166 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM166 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11351] VGAM166 gene encodes a VGAM166 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM166 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM166 precursor RNA is designated SEQ ID:152, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:152 is located at position 222866 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11352] VGAM166 precursor RNA folds onto itself, forming VGAM166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11353] An enzyme complex designated DICER COMPLEX, `dices` the VGAM166 folded precursor RNA into VGAM166 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM166 RNA is designated SEQ ID:2877, and is provided hereinbelow with reference to the sequence listing part.

[11354] VGAM166 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM166 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM166 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[11355] VGAM166 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM166 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM166 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM166 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM166 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11356] The complementary binding of VGAM166 RNA, herein designated VGAM RNA, to host target binding sites on VGAM166 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM166 host target RNA into VGAM166 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11357] It is appreciated that VGAM166 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM166 host target genes. The mRNA of each one of this plurality of VGAM166 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM166 RNA, herein designated VGAM RNA, and which when bound by VGAM166 RNA causes inhibition of translation of respective one or more VGAM166 host target proteins.

[11358] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM166 gene, herein designated VGAM GENE, on one or more VGAM166 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11359] It is yet further appreciated that a function of VGAM166 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM166 correlate with, and may be deduced from, the identity of the host target genes which VGAM166 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11360] Nucleotide sequences of the VGAM166 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM166 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM166 are further described hereinbelow with reference to Table 1.

[11361] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM166 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM166 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[11362] As mentioned hereinabove with reference to Fig. 1, a function of VGAM166 gene, herein designated VGAM is inhibition of expression of VGAM166 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM166 correlate with, and may be deduced from, the identity of the target genes which VGAM166 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11363] Cholinergic Receptor, Nicotinic, Beta Polypeptide 2 (neuronal) (CHRNA2, Accession NM_000748) is a VGAM166 host target gene. CHRNA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHRNA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRNA2 BINDING SITE, designated SEQ ID:6401, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also designated SEQ ID:2877.

[11364] A function of VGAM166 is therefore inhibition of Cholinergic Receptor, Nicotinic, Beta Polypeptide 2 (neuronal)

(CHRNA2, Accession NM_000748), a gene which mediates fast signal transmission at synapses. Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRNA2. The function of CHRNA2 has been established by previous studies. The nicotinic acetylcholine receptors (OMIM Ref. No. nAChRs) are members of a superfamily of ligand-gated ion channels that mediate fast signal transmission at synapses. The nAChRs are thought to be (OMIM Ref. No. hetero)pentamers composed of homologous subunits. See 118508 for additional background information on nAChRs. In affected members of a Scottish family with type 3 nocturnal frontal lobe epilepsy (OMIM Ref. No. 605375), Phillips et al. (2001) identified a G-to-A transition at nucleotide 1025 in the CHRNA2 gene, resulting in a val287-to-met (V287M) substitution within the M2 domain. Codon 287 was also involved in the family reported by De Fusco et al. (2000); see 118507.0001. The mutation is located in an evolutionarily conserved region of the gene. Functional receptors with the V287M mutation were highly expressed in *Xenopus* oocytes and characterized by an approximately 10-fold increase in acetylcholine sensitivity. Animal model experiments lend further support to

the function of CHRNA2. Picciotto et al. (1995) disrupted the CHRNA2 mouse homolog in embryonic stem (ES) cells to generate 'knockout' mice deficient in this subunit. Homozygous mice were viable, mated normally, and showed no obvious physical deficits. However, their brains showed absence of high-affinity binding sites for nicotine, and electrophysiologic recordings from brain slices showed that thalamic neurons did not respond to nicotine application. Furthermore, behavioral tests demonstrated that nicotine no longer augmented the performance of the deficient mice on passive avoidance, a test of associative memory. Paradoxically, mutant mice were able to perform better than their nonmutant sibs on this task.

[11365] It is appreciated that the abovementioned animal model for CHRNA2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[11366] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11367] Phillips, H. A.; Favre, I.; Kirkpatrick, M.; Zuberi, S. M.; Goudie, D.; Heron, S. E.; Scheffer, I. E.; Sutherland, G. R.; Berkovic, S. F.; Bertrand, D.; Mulley, J. C. : CHRNA2 is the

second acetylcholine receptor subunit associated with autosomal dominant nocturnal frontal lobe epilepsy. Am. J. Hum. Genet. 68: 225–231, 2001. ; and

- [11368] De Fusco, M.; Becchetti, A.; Patrignani, A.; Annesi, G.; Gambardella, A.; Quattrone, A.; Ballabio, A.; Wanke, E.; Casari, G. : The nicotinic receptor beta-2 subunit is mutant in nocturn.
- [11369] Further studies establishing the function and utilities of CHRNA2 are found in John Hopkins OMIM database record ID 118507, and in cited publications numbered 12690–4453, 12691, 390, 12692, 12693–12694, 39 and 12695 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transcription Factor 8 (represses interleukin 2 expression) (TCF8, Accession NM_030751) is another VGAM166 host target gene. TCF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF8 BINDING SITE, designated SEQ ID:25037, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2877.

[11370] Another function of VGAM166 is therefore inhibition of Transcription Factor 8 (represses interleukin 2 expression) (TCF8, Accession NM_030751), a gene which may be responsible for transcriptional repression of the il-2 gene and regulates the promoter activity of the atp1a1 gene . Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF8. The function of TCF8 has been established by previous studies. TCF8 encodes a human zinc finger transcription factor (Nil-2-a, negative regulator of IL2) that represses T-lymphocyte-specific interleukin-2 gene expression by interacting with a negative regulatory domain within the IL2 gene promoter/enhancer (Williams et al., 1991). Nil-2-a inhibits IL2 gene expression by binding to a negative regulatory domain 100 nucleotides 5-prime of the IL2 transcription start site. Williams et al. (1992) used Southern hybridization and somatic cell hybrids to demonstrate that the murine and human genomes contain homologous genes and that the TCF8 gene resides on human chromosome 10. Fluorescence in situ hybridization localized TCF8 to 10p11.2.

[11371] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [11372] Williams, T. M.; Montoya, G.; Wu, Y.; Eddy, R. L.; Byers, M. G.; Shows, T. B. : The TCF8 gene encoding a zinc finger protein (Nil-2-a) resides on human chromosome 10p11.2. Genomics 14: 194-196, 1992. ; and
- [11373] Williams, T. M.; Moolten, D.; Burlein, J.; Romano, J.; Bhaerman, R.; Godillot, A.; Mellon, M.; Rauscher, F. J., III; Kant, J. A. : Identification of a zinc finger protein that inhibits.
- [11374] Further studies establishing the function and utilities of TCF8 are found in John Hopkins OMIM database record ID 189909, and in cited publications numbered 1266 and 12683 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 20 Open Reading Frame 97 (C20orf97, Accession NM_021158) is another VGAM166 host target gene. C20orf97 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf97, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf97 BINDING SITE, designated SEQ ID:22138, to the nucleotide sequence of VGAM166

RNA, herein designated VGAM RNA, also designated SEQ ID:2877.

[11375] Another function of VGAM166 is therefore inhibition of Chromosome 20 Open Reading Frame 97 (C20orf97, Accession NM_021158). Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf97. DKFZp762E1511 (Accession XM_003460) is another VGAM166 host target gene. DKFZp762E1511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762E1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762E1511 BINDING SITE, designated SEQ ID:29936, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also designated SEQ ID:2877.

[11376] Another function of VGAM166 is therefore inhibition of DKFZp762E1511 (Accession XM_003460). Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1511. FLJ11618 (Accession NM_022452)

is another VGAM166 host target gene. FLJ11618 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11618 BINDING SITE, designated SEQ ID:22791, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also designated SEQ ID:2877.

[11377] Another function of VGAM166 is therefore inhibition of FLJ11618 (Accession NM_022452). Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11618. FLJ14326 (Accession NM_032191) is another VGAM166 host target gene. FLJ14326 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14326 BINDING SITE, designated SEQ ID:25903, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also designated SEQ ID:2877.

[11378] Another function of VGAM166 is therefore inhibition of FLJ14326 (Accession NM_032191). Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14326. KIAA0863 (Accession XM_170863) is another VGAM166 host target gene. KIAA0863 BINDING SITE1 and KIAA0863 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0863, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0863 BINDING SITE1 and KIAA0863 BINDING SITE2, designated SEQ ID:45633 and SEQ ID:17153 respectively, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also designated SEQ ID:2877.

[11379] Another function of VGAM166 is therefore inhibition of KIAA0863 (Accession XM_170863). Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0863. KIAA1655 (Accession XM_039442) is another VGAM166 host target gene. KIAA1655 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1655, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:33082, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also designated SEQ ID:2877.

[11380] Another function of VGAM166 is therefore inhibition of KIAA1655 (Accession XM_039442). Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655. Olfactory Receptor, Family 7, Subfamily C, Member 1 (OR7C1, Accession NM_017506) is another VGAM166 host target gene. OR7C1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OR7C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OR7C1 BINDING SITE, designated SEQ ID:18960, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also designated SEQ ID:2877.

[11381] Another function of VGAM166 is therefore inhibition of Olfactory Receptor, Family 7, Subfamily C, Member 1

(OR7C1, Accession NM_017506). Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OR7C1. SEC22C (Accession NM_004206) is another VGAM166 host target gene. SEC22C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC22C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC22C BINDING SITE, designated SEQ ID:10404, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also designated SEQ ID:2877.

[11382] Another function of VGAM166 is therefore inhibition of SEC22C (Accession NM_004206). Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC22C. ZFP106 (Accession NM_022473) is another VGAM166 host target gene. ZFP106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of ZFP106 BINDING SITE, designated SEQ ID:22835, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also designated SEQ ID:2877.

[11383] Another function of VGAM166 is therefore inhibition of ZFP106 (Accession NM_022473). Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP106. LOC147043 (Accession XM_102732) is another VGAM166 host target gene. LOC147043 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147043 BINDING SITE, designated SEQ ID:42144, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also designated SEQ ID:2877.

[11384] Another function of VGAM166 is therefore inhibition of LOC147043 (Accession XM_102732). Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147043. LOC147229 (Accession XM_085742) is an-

other VGAM166 host target gene. LOC147229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147229 BINDING SITE, designated SEQ ID:38321, to the nucleotide sequence of VGAM166 RNA, herein designated VGAM RNA, also designated SEQ ID:2877.

[11385] Another function of VGAM166 is therefore inhibition of LOC147229 (Accession XM_085742). Accordingly, utilities of VGAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147229. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 167 (VGAM167) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11386] VGAM167 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM167 was detected is described

hereinabove with reference to Figs. 1–8.

[11387] VGAM167 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM167 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11388] VGAM167 gene encodes a VGAM167 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM167 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM167 precursor RNA is designated SEQ ID:153, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:153 is located at position 169164 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11389] VGAM167 precursor RNA folds onto itself, forming VGAM167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11390] An enzyme complex designated DICER COMPLEX, `dices` the VGAM167 folded precursor RNA into VGAM167 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM167 RNA is designated SEQ ID:2878, and is provided hereinbelow with reference to the sequence listing part.

[11391] VGAM167 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM167 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM167 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11392] VGAM167 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM167 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM167 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM167 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM167 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[11393] The complementary binding of VGAM167 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM167 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM167 host target RNA into VGAM167 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11394] It is appreciated that VGAM167 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM167 host target genes. The mRNA of each one of this plurality of VGAM167 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM167 RNA, herein designated VGAM RNA, and which when bound by VGAM167 RNA causes inhibition of translation of respective one or more VGAM167 host target proteins.

[11395] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM167 gene, herein designated VGAM GENE, on one or more VGAM167 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11396] It is yet further appreciated that a function of VGAM167 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM167 correlate with, and may be deduced from, the identity of the host target genes which VGAM167 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11397] Nucleotide sequences of the VGAM167 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM167 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM167 are further described hereinbelow with reference to Table 1.

[11398] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM167 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM167 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11399] As mentioned hereinabove with reference to Fig. 1, a function of VGAM167 gene, herein designated VGAM is inhibition of expression of VGAM167 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM167 correlate with, and may be deduced from, the identity of the target genes which VGAM167 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11400] CD3Z Antigen, Zeta Polypeptide (TiT3 complex) (CD3Z, Accession NM_000734) is a VGAM167 host target gene. CD3Z BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by CD3Z, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD3Z BINDING SITE, designated SEQ ID:6392, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:2878.

[11401] A function of VGAM167 is therefore inhibition of CD3Z Antigen, Zeta Polypeptide (TiT3 complex) (CD3Z, Accession NM_000734), a gene which may involve in assembly and expression of the tcr complex as well as signal transduction upon antigen triggering. Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD3Z. The function of CD3Z has been established by previous studies. Alarcon et al. (1988) described 2 brothers who had a low expression of antigen receptor on the surface of their T lymphocytes. Functional analyses of their T cells showed impaired immune response to alloantigens, tetanus toxoid, and mitogens. Biochemical studies showed reduced intracellular expression of CD3-zeta chains; all other components of the T-cell receptor-CD3 complex were expressed normally. Alarcon et al. (1988) suggested that the

impaired association of the CD3–zeta chain with the other chains of the complex was the primary defect leading to the low expression of T–cell receptor–CD3 complex and immunodeficiency in these children. Failure to thrive had been diagnosed in the proband at 11 months; subsequently, chronic anorexia, diarrhea, and recurrent episodes of bronchopneumonia were noted. The diarrhea was shown to be associated with a malabsorption syndrome, which was unresponsive to a gluten–free diet. Biopsy of the small bowel showed absence of villi; however, the patient was negative for HLA–DR3 and –DR7. The boy died of severe autoimmune hemolytic anemia at the age of 3 years. The patient's brother had required hospital admission for respiratory infection, but on the whole was much more mildly affected than his brother. Animal model experiments lend further support to the function of CD3Z. Class I MHC molecules, known to be important for immune responses to antigen, are expressed also by neurons that undergo activity–dependent, long–term structural and synaptic modifications. Huh et al. (2000) showed that in mice genetically deficient for cell surface class I MHC, due to deletion of either TAP1 (OMIM Ref. No. 170260) or beta–2–microglobulin (OMIM Ref. No.

109700), or for the class I MHC receptor component CD3Z, refinement of connections between retina and central targets during development is incomplete. In the hippocampus of adult mutants, N-methyl-D-aspartate receptor-dependent long-term potentiation is enhanced, and long-term depression is absent. Specific class I MHC mRNAs are expressed by distinct mosaics of neurons, reflecting a potential for diverse neuronal functions. These results demonstrated an important role for these molecules in the activity-dependent remodeling and plasticity of connections in the developing and mature mammalian central nervous system.

[11402] It is appreciated that the abovementioned animal model for CD3Z is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[11403] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11404] Huh, G. S.; Boulanger, L. M.; Du, H.; Riquelme, P. A.; Brotz, T. M.; Shatz, C. J. : Functional requirement for class I MHC in CNS development and plasticity. Science 290: 2155-2159, 2000. ; and

[11405] Alarcon, B.; Regueiro, J. R.; Arnaiz-Villena, A.; Terhorst, C. : Familial defect in the surface expression of the T-cell receptor-CD3 complex. New Eng. J. Med. 319: 1203-1208, 1988.

[11406] Further studies establishing the function and utilities of CD3Z are found in John Hopkins OMIM database record ID 186780, and in cited publications numbered 5687-5690, 1946, 569 and 10857-5694 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 22 Receptor, Alpha 2 (IL22RA2, Accession NM_052962) is another VGAM167 host target gene. IL22RA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL22RA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL22RA2 BINDING SITE, designated SEQ ID:27522, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:2878.

[11407] Another function of VGAM167 is therefore inhibition of Interleukin 22 Receptor, Alpha 2 (IL22RA2, Accession NM_052962), a gene which induces the production of

acute-phase reactants. Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL22RA2. The function of IL22RA2 has been established by previous studies. IL22 (OMIM Ref. No. 605330), a homolog of IL10 (OMIM Ref. No. 124092), is secreted by T cells and binds to and signals through the class II cytokine receptor family (CRF) heterodimer IL22R (OMIM Ref. No. 605457)/IL10RB (OMIM Ref. No. 123889). IL22 induces the production of acute-phase reactants. By DNA database screening for sequences with homology to the extracellular domain of IL10RB and analysis of 6q24 BAC clone, Dumoutier et al. (2001) identified a cDNA encoding IL22BP, which they designated CRF2X. Sequence analysis predicted that the 231-amino acid protein, approximately 33% identical to the extracellular domains of IL20RA (OMIM Ref. No. 605620) and IL22R, contains a signal peptide, 4 cysteines conserved among members of the class II cytokine receptor family, and 5 potential N-linked glycosylation sites, but lacks a transmembrane domain. RT-PCR analysis detected expression in breast, lungs, and intestinal tract, with lower levels in skin, testis, brain, heart, and thymus. ELISA showed that IL22BP does indeed bind IL22. Func-

tional and luciferase reporter analysis indicated that IL22BP specifically blocked IL22-induced STAT3 (OMIM Ref. No. 102582) activation in an intestinal epithelial cell line. Using similar methods, Kotenko et al. (2001) also cloned and characterized IL22BP, which they initially designated CRF2-10. Western blot analysis showed expression of a 34- to 35-kD glycosylated secreted protein. Crosslinking and autoradiographic analysis confirmed the interaction of IL22 and IL22BP. Functional analysis indicated that IL22BP inhibited IL22-mediated MHC class I antigen expression. EMSA analysis demonstrated inhibition of STAT1 (OMIM Ref. No. 600555) and STAT3 DNA-binding complexes. Northern blot analysis showed blocking of SOCS3 (OMIM Ref. No. 604176) expression.

[11408] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11409] Dumoutier, L.; Lejeune, D.; Colau, D.; Renauld, J. C. : Cloning and characterization of IL-22 binding protein, a natural antagonist of IL-10-related T cell-derived inducible factor/IL 22. J. Immun. 166: 7090-7095, 2001. ; and

[11410] Kotenko, S. V.; Izotova, L. S.; Mirochnitchenko, O. V.; Es-

terova, E.; Dickensheets, H.; Donnelly, R. P.; Pestka, S. :
Identification, cloning, and characterization of a novel soluble re.

[11411] Further studies establishing the function and utilities of IL22RA2 are found in John Hopkins OMIM database record ID 606648, and in cited publications numbered 6128–6130 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Inwardly-rectifying Channel, Subfamily J, Member 10 (KCNJ10, Accession NM_002241) is another VGAM167 host target gene. KCNJ10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNJ10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ10 BINDING SITE, designated SEQ ID:8027, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:2878.

[11412] Another function of VGAM167 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 10 (KCNJ10, Accession NM_002241), a gene which may be responsible for potassium buffering action of glial

cells in the brain. Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ10. The function of KCNJ10 has been established by previous studies.

Potassium channels have been found in virtually all cells, and a large number of K(+) channel cDNAs have been cloned. They are generally classified into voltage-dependent (Kv) type (e.g., 176258 and 176264) and inwardly rectifying (Kir) type (e.g., 602106 and 600937). The former possesses 6 putative transmembrane regions, while the latter has 2 putative transmembrane regions. Doupnik et al. (1995) reported that Kir channels exhibit various physiologic functions, such as the maintenance of the resting membrane potential, the generation of prolonged action potentials, the modulation of cell excitability, and the transport of potassium ions. Takumi et al. (1995) reported that the K(AB)-2/Kir4.1 inwardly rectifying K(+) channel of rat has an ATP-binding domain of Walker-type A motif in the C-terminal intracellular region and is expressed in brain and kidney. In situ hybridization demonstrated that it is expressed predominantly in glial cells of rat membrane but also in the retinal Muller glial cells and marginal cells of the inner ear. By interspecific backcross

analysis, Tada et al. (1997) demonstrated that the mouse gene encoding the glial inwardly rectifying potassium channel, symbolized Kcnj10 by them, maps to distal chromosome 1. Because of homology of this region of the mouse genome to human 1q, Tada et al. (1997) suggested that the putative human homolog, KCNJ10, maps to 1q

[11413] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11414] Doupnik, C. A.; Davidson, N.; Lester, H. A. : The inward rectifier potassium channel family. Curr. Opin. Neurobiol. 5: 268–277, 1995. ; and

[11416] Further studies establishing the function and utilities of KCNJ10 are found in John Hopkins OMIM database record ID 602208, and in cited publications numbered 8843–8845 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM_018152) is another VGAM167 host target

gene. C20orf12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf12 BINDING SITE, designated SEQ ID:19959, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:2878.

[11417] Another function of VGAM167 is therefore inhibition of Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM_018152). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf12.

KIAA0528 (Accession XM_051454) is another VGAM167 host target gene. KIAA0528 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0528, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0528 BINDING SITE, designated SEQ ID:35841, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:2878.

[11418] Another function of VGAM167 is therefore inhibition of KIAA0528 (Accession XM_051454). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0528. KIAA1493 (Accession XM_034415) is another VGAM167 host target gene. KIAA1493 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:32089, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:2878.

[11419] Another function of VGAM167 is therefore inhibition of KIAA1493 (Accession XM_034415). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493. LOC51145 (Accession NM_016158) is another VGAM167 host target gene. LOC51145 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51145, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51145 BINDING SITE, designated SEQ ID:18248, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:2878.

[11420] Another function of VGAM167 is therefore inhibition of LOC51145 (Accession NM_016158). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51145. LOC92218 (Accession XM_043647) is another VGAM167 host target gene. LOC92218 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92218 BINDING SITE, designated SEQ ID:33985, to the nucleotide sequence of VGAM167 RNA, herein designated VGAM RNA, also designated SEQ ID:2878.

[11421] Another function of VGAM167 is therefore inhibition of LOC92218 (Accession XM_043647). Accordingly, utilities of VGAM167 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC92218. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 168 (VGAM168) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11422] VGAM168 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM168 was detected is described hereinabove with reference to Figs. 1–8.

[11423] VGAM168 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM168 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11424] VGAM168 gene encodes a VGAM168 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM168 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM168 precursor RNA is designated SEQ

ID:154, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:154 is located at position 286571 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11425] VGAM168 precursor RNA folds onto itself, forming VGAM168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11426] An enzyme complex designated DICER COMPLEX, `dices` the VGAM168 folded precursor RNA into VGAM168 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM168 RNA is designated SEQ ID:2879, and

is provided hereinbelow with reference to the sequence listing part.

[11427] VGAM168 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM168 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM168 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11428] VGAM168 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM168 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM168 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM168 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM168 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11429] The complementary binding of VGAM168 RNA, herein designated VGAM RNA, to host target binding sites on VGAM168 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM168 host target RNA into VGAM168 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11430] It is appreciated that VGAM168 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM168 host target genes. The mRNA of each one of this plurality of VGAM168 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM168 RNA, herein designated VGAM RNA, and which when bound by VGAM168 RNA causes inhibition of translation of respective one or more VGAM168 host target proteins.

[11431] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM168 gene, herein designated VGAM GENE, on one or more VGAM168 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11432] It is yet further appreciated that a function of VGAM168 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM168 correlate with, and may be deduced from, the identity of the host target genes which VGAM168 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11433] Nucleotide sequences of the VGAM168 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM168 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM168 are further described hereinbelow with reference to Table 1.

[11434] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM168 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM168 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11435] As mentioned hereinabove with reference to Fig. 1, a function of VGAM168 gene, herein designated VGAM is inhibition of expression of VGAM168 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM168 correlate with, and may be deduced from, the identity of the target genes which VGAM168 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11436] RAS, Dexamethasone-induced 1 (RASD1, Accession NM_016084) is a VGAM168 host target gene. RASD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASD1 BINDING SITE, designated SEQ ID:18167, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:2879.

[11437] A function of VGAM168 is therefore inhibition of RAS, Dexamethasone-induced 1 (RASD1, Accession NM_016084), a gene which is a novel physiologic NO effector. Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with RASD1. The function of RASD1 has been established by previous studies. Using differential display, Kemppainen and Behrend (1998) identified Dexras1, a novel RAS superfamily gene induced by dexamethasone in AtT-20 cells (mouse-derived corticotroph tumor cells). The deduced 280-amino acid mouse protein shares highest homology (36% identity) with human RAP2B (OMIM Ref. No. 179541). Northern blot analysis of mouse tissues detected expression of Dexras1 in brain, heart, kidney, and liver. By yeast 2-hybrid screening of a lung cDNA library with the third SH3 domain of NCK2 (OMIM Ref. No. 604930) as bait, Tu and Wu (1999) isolated a cDNA encoding RASD1, which they called DEXRAS1. The deduced 281-amino acid protein, which is 98% identical to the mouse protein, contains a P loop, guanine base-binding loops, and a C-terminal farnesylation site. SDS-PAGE analysis detected a 33-kD protein, close to the predicted size. Northern blot analysis revealed ubiquitous expression of a 5.0-kb RASD1 transcript, with highest levels in heart. Dexamethasone exposure upregulated RASD1 expression.

- [11441] Further studies establishing the function and utilities of RASD1 are found in John Hopkins OMIM database record ID 605550, and in cited publications numbered 6402-6404 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Serine Racemase (SRR, Accession NM_021947) is another VGAM168 host target gene. SRR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRR BINDING SITE, designated SEQ ID:22474, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:2879.

[11442] Another function of VGAM168 is therefore inhibition of Serine Racemase (SRR, Accession NM_021947). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRR. DKFZp762E1511 (Accession XM_003460) is another VGAM168 host target gene. DKFZp762E1511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762E1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762E1511 BINDING SITE, designated SEQ ID:29933, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:2879.

[11443] Another function of VGAM168 is therefore inhibition of DKFZp762E1511 (Accession XM_003460). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1511. SDS3 (Accession XM_045014) is another VGAM168 host target gene. SDS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDS3, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDS3 BINDING SITE, designated SEQ ID:34318, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:2879.

[11444] Another function of VGAM168 is therefore inhibition of SDS3 (Accession XM_045014). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDS3. LOC151248 (Accession XM_087143) is another VGAM168 host target gene. LOC151248 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151248 BINDING SITE, designated SEQ ID:39086, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:2879.

[11445] Another function of VGAM168 is therefore inhibition of LOC151248 (Accession XM_087143). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC151248. LOC153810 (Accession XM_087778) is another VGAM168 host target gene. LOC153810 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153810 BINDING SITE, designated SEQ ID:39412, to the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:2879.

[11446] Another function of VGAM168 is therefore inhibition of LOC153810 (Accession XM_087778). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153810. LOC170425 (Accession XM_084330) is another VGAM168 host target gene. LOC170425 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC170425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170425 BINDING SITE, designated SEQ ID:37551, to

the nucleotide sequence of VGAM168 RNA, herein designated VGAM RNA, also designated SEQ ID:2879.

[11447] Another function of VGAM168 is therefore inhibition of LOC170425 (Accession XM_084330). Accordingly, utilities of VGAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170425. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 169 (VGAM169) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11448] VGAM169 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM169 was detected is described hereinabove with reference to Figs. 1–8.

[11449] VGAM169 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM169 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11450] VGAM169 gene encodes a VGAM169 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM169 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM169 precursor RNA is designated SEQ ID:155, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:155 is located at position 40241 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11451] VGAM169 precursor RNA folds onto itself, forming VGAM169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11452] An enzyme complex designated DICER COMPLEX, `dices` the VGAM169 folded precursor RNA into VGAM169 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM169 RNA is designated SEQ ID:2880, and is provided hereinbelow with reference to the sequence listing part.

[11453] VGAM169 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM169 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM169 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11454] VGAM169 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM169 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM169 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM169 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM169 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11455] The complementary binding of VGAM169 RNA, herein designated VGAM RNA, to host target binding sites on VGAM169 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM169 host target RNA into VGAM169 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11456] It is appreciated that VGAM169 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM169 host target genes. The mRNA of each one of this plurality of VGAM169 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM169 RNA, herein designated VGAM RNA, and which when bound by VGAM169 RNA causes inhibition of translation of respective one or more VGAM169 host target proteins.

[11457] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM169 gene, herein designated VGAM GENE, on one or more VGAM169 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[11458] It is yet further appreciated that a function of VGAM169 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM169 correlate with, and may be deduced from, the identity of the host target genes which VGAM169 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11459] Nucleotide sequences of the VGAM169 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM169 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM169 are further described hereinbelow with reference to Table 1.

[11460] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM169 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM169 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11461] As mentioned hereinabove with reference to Fig. 1, a function of VGAM169 gene, herein designated VGAM is inhibition of expression of VGAM169 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM169 correlate with, and may be deduced from, the identity of the target genes which VGAM169 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11462] Astrotactin (ASTN, Accession XM_045113) is a VGAM169 host target gene. ASTN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ASTN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASTN BINDING SITE, designated SEQ ID:34361, to the nucleotide sequence of VGAM169 RNA, herein designated VGAM RNA, also designated SEQ ID:2880.

[11463] A function of VGAM169 is therefore inhibition of Astro-tactin (ASTN, Accession XM_045113). Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASTN. Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is another VGAM169 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:7485, to the nucleotide sequence of VGAM169 RNA, herein designated VGAM RNA, also designated SEQ ID:2880.

[11464] Another function of VGAM169 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725) is another VGAM169 host target gene. FANCF BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by FANCF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCF BINDING SITE, designated SEQ ID:22922, to the nucleotide sequence of VGAM169 RNA, herein designated VGAM RNA, also designated SEQ ID:2880.

[11465] Another function of VGAM169 is therefore inhibition of Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725). Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCF. Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM_080821) is another VGAM169 host target gene. C20orf108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf108 BINDING SITE, designated SEQ ID:28087, to the nucleotide sequence of VGAM169 RNA, herein designated VGAM RNA, also designated SEQ

ID:2880.

[11466] Another function of VGAM169 is therefore inhibition of Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM_080821). Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf108. Cyclin G2 (CCNG2, Accession NM_004354) is another VGAM169 host target gene. CCNG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCNG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNG2 BINDING SITE, designated SEQ ID:10560, to the nucleotide sequence of VGAM169 RNA, herein designated VGAM RNA, also designated SEQ ID:2880.

[11467] Another function of VGAM169 is therefore inhibition of Cyclin G2 (CCNG2, Accession NM_004354). Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNG2. CDC42 Binding Protein Kinase Beta (DMPK-like) (CDC42BPB, Accession NM_006035) is another VGAM169 host target gene. CDC42BPB BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDC42BPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC42BPB BINDING SITE, designated SEQ ID:12657, to the nucleotide sequence of VGAM169 RNA, herein designated VGAM RNA, also designated SEQ ID:2880.

[11468] Another function of VGAM169 is therefore inhibition of CDC42 Binding Protein Kinase Beta (DMPK-like) (CDC42BPB, Accession NM_006035). Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC42BPB. KIAA0210 (Accession NM_014744) is another VGAM169 host target gene. KIAA0210 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0210 BINDING SITE, designated SEQ ID:16425, to the nucleotide sequence of VGAM169 RNA, herein designated VGAM RNA, also designated SEQ ID:2880.

[11469] Another function of VGAM169 is therefore inhibition of KIAA0210 (Accession NM_014744). Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0210. KIAA1486 (Accession XM_041126) is another VGAM169 host target gene. KIAA1486 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1486 BINDING SITE, designated SEQ ID:33460, to the nucleotide sequence of VGAM169 RNA, herein designated VGAM RNA, also designated SEQ ID:2880.

[11470] Another function of VGAM169 is therefore inhibition of KIAA1486 (Accession XM_041126). Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1486. LOC146823 (Accession XM_097105) is another VGAM169 host target gene. LOC146823 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146823, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146823 BINDING SITE, designated SEQ ID:40748, to the nucleotide sequence of VGAM169 RNA, herein designated VGAM RNA, also designated SEQ ID:2880.

[11471] Another function of VGAM169 is therefore inhibition of LOC146823 (Accession XM_097105). Accordingly, utilities of VGAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146823. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 170 (VGAM170) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11472] VGAM170 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM170 was detected is described hereinabove with reference to Figs. 1–8.

[11473] VGAM170 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM170 host

target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11474] VGAM170 gene encodes a VGAM170 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM170 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM170 precursor RNA is designated SEQ ID:156, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:156 is located at position 152649 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11475] VGAM170 precursor RNA folds onto itself, forming VGAM170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11476] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM170 folded precursor RNA into VGAM170 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM170 RNA is designated SEQ ID:2881, and is provided hereinbelow with reference to the sequence listing part.

[11477] VGAM170 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM170 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM170 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11478] VGAM170 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM170 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM170 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM170 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM170 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11479] The complementary binding of VGAM170 RNA, herein designated VGAM RNA, to host target binding sites on VGAM170 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM170 host target RNA into VGAM170 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11480] It is appreciated that VGAM170 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM170 host target genes. The mRNA of each one of this plurality of VGAM170 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM170 RNA, herein designated VGAM RNA, and which when bound by VGAM170 RNA causes inhibition of translation of respective one or more VGAM170 host target proteins.

[11481] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM170 gene, herein designated VGAM GENE, on one or more VGAM170 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11482] It is yet further appreciated that a function of VGAM170 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM170 correlate with, and may be deduced from, the identity of the host target genes which VGAM170 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11483] Nucleotide sequences of the VGAM170 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM170 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM170 are further

described hereinbelow with reference to Table 1.

[11484] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM170 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM170 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11485] As mentioned hereinabove with reference to Fig. 1, a function of VGAM170 gene, herein designated VGAM is inhibition of expression of VGAM170 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM170 correlate with, and may be deduced from, the identity of the target genes which VGAM170 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11486] Inhibitor of Growth Family, Member 1 (ING1, Accession NM_005537) is a VGAM170 host target gene. ING1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ING1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ING1

BINDING SITE, designated SEQ ID:12062, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:2881.

[11487] A function of VGAM170 is therefore inhibition of Inhibitor of Growth Family, Member 1 (ING1, Accession NM_005537), a gene which acts as a potent growth regulator in normal and in established cells. Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ING1. The function of ING1 has been established by previous studies. Garkavtsev et al. (1996) described a new strategy for the isolation of tumor suppressor genes. This strategy was based on subtractive hybridization followed by selection of transforming genetic suppressor elements. It was used to isolate a novel gene called ING1 which encodes a 33-kD protein (294 amino acids) that displays the characteristics of a tumor suppressor gene. Garkavtsev et al. (1996) reported that expression of high levels of transfected constructs of this gene inhibited growth, while chronic expression of antisense constructs promoted cell transformation. They observed reduced expression of ING1 in some breast cancer cell lines and mutation of ING1 in neuroblastoma cells. Garkavtsev et al. (1997)

showed, using indirect immunofluorescence, that the p33(ING1) protein is located in the nucleus, which is consistent with its proposed role as a growth regulator. By fluorescence in situ hybridization, they localized the ING1 gene to 13q33–q34. Using the radiation hybrid mapping technique, Zeremski et al. (1997) mapped ING1 to 13q34.

[11488] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11491] Further studies establishing the function and utilities of ING1 are found in John Hopkins OMIM database record ID 601566, and in cited publications numbered 2787–278 and 6496–2790 listed in the bibliography section herein–below, which are also hereby incorporated by refer–

ence.FLJ12476 (Accession NM_022784) is another VGAM170 host target gene. FLJ12476 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12476 BINDING SITE, designated SEQ ID:23069, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also designated SEQ ID:2881.

[11492] Another function of VGAM170 is therefore inhibition of FLJ12476 (Accession NM_022784). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12476. KIAA1715 (Accession XM_042834) is another VGAM170 host target gene. KIAA1715 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1715 BINDING SITE, designated SEQ ID:33787, to the nucleotide sequence of VGAM170 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2881.

[11493] Another function of VGAM170 is therefore inhibition of KIAA1715 (Accession XM_042834). Accordingly, utilities of VGAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1715. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 171 (VGAM171) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11494] VGAM171 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM171 was detected is described hereinabove with reference to Figs. 1–8.

[11495] VGAM171 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM171 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11496] VGAM171 gene encodes a VGAM171 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM171 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM171 precursor RNA is designated SEQ ID:157, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:157 is located at position 113416 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11497] VGAM171 precursor RNA folds onto itself, forming VGAM171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11498] An enzyme complex designated DICER COMPLEX, `dices` the VGAM171 folded precursor RNA into VGAM171 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM171 RNA is designated SEQ ID:2882, and is provided hereinbelow with reference to the sequence listing part.

[11499] VGAM171 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM171 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM171 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11500] VGAM171 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM171 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM171 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM171 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM171 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11501] The complementary binding of VGAM171 RNA, herein designated VGAM RNA, to host target binding sites on VGAM171 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM171 host target RNA into VGAM171 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11502] It is appreciated that VGAM171 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM171 host target genes. The mRNA of each one of this plurality of VGAM171 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM171 RNA, herein designated VGAM RNA, and which when bound by VGAM171 RNA causes inhibition of translation of respective one or more VGAM171 host target proteins.

[11503] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM171 gene, herein designated VGAM GENE, on one or more VGAM171 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[11504] It is yet further appreciated that a function of VGAM171 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM171 correlate with, and may be deduced from, the identity of the host target genes which VGAM171 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11505] Nucleotide sequences of the VGAM171 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM171 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM171 are further described hereinbelow with reference to Table 1.

[11506] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM171 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM171 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11507] As mentioned hereinabove with reference to Fig. 1, a function of VGAM171 gene, herein designated VGAM is inhibition of expression of VGAM171 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM171 correlate with, and may be deduced from, the identity of the target genes which VGAM171 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11508] ARP1 Actin-related Protein 1 Homolog B, Centractin Beta (yeast) (ACTR1B, Accession XM_047780) is a VGAM171 host target gene. ACTR1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACTR1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTR1B BINDING SITE, designated SEQ ID:35053, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:2882.

[11509] A function of VGAM171 is therefore inhibition of ARP1 Actin-related Protein 1 Homolog B, Centractin Beta (yeast) (ACTR1B, Accession XM_047780), a gene which component of a multi-subunit complex involved in microtubule based vesicle motility. Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTR1B. The function of ACTR1B has been established by previous studies. Isoforms of actin (e.g., ACTG1; 102560), in association with myosin motor proteins (e.g., MYO1A; 601478), are required for cellular motile processes. In addition to conventional actins, there are several actin-related proteins (e.g., ACTR2; 604221). By searching an EST database and by screening a testis cDNA library, Clark et al. (1994) isolated cDNAs encoding ACTR1B, which they called beta-centractin. The deduced 376-amino acid ACTR1B protein and the ACTR1A protein (OMIM Ref. No. 605143) are of equal length, and they share 90% amino acid identity and 96% amino acid similarity. Northern blot analysis detected a 2.0-kb ACTR1B transcript at variable levels in all tissues tested. Two-dimensional immunoblot analysis determined that ACTR1B is expressed in the cytosol as part of the dynactin complex, an activator of dynein-driven vesicle

movement (see OMIM Ref. No. 601143), as a 43-kD protein with a pI of 6.4; levels of ACTR1B were at least 15-fold lower than those of ACTR1A. By somatic cell hybrid analysis, Elsea et al. (1999) mapped the ACTR1B gene to chromosome 2. They localized the ACTR1B gene to 2q11.1–q11.2 using FISH.

[11510] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11511] Clark, S. W.; Staub, O.; Clark, I. B.; Holzbaur, E. L. F.; Paschal, B. M.; Vallee, R. B.; Meyer, D. I. : Beta-centractin: characterization and distribution of a new member of the centractin family of actin-related proteins. *Molec. Biol. Cell* 5: 1301–1310, 1994. ; and

[11513] Further studies establishing the function and utilities of ACTR1B are found in John Hopkins OMIM database record ID 605144, and in cited publications numbered 2875–2876 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer–

ence.Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM_005093) is another VGAM171 host target gene. CBFA2T2 BINDING SITE1 and CBFA2T2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CBFA2T2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE1 and CBFA2T2 BINDING SITE2, designated SEQ ID:11555 and SEQ ID:11550 respectively, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:2882.

[11514] Another function of VGAM171 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM_005093), a gene which is a putative transcription factor. Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2. The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.POU Domain, Class 2,

Associating Factor 1 (POU2AF1, Accession NM_006235) is another VGAM171 host target gene. POU2AF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POU2AF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU2AF1 BINDING SITE, designated SEQ ID:12895, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:2882.

[11515] Another function of VGAM171 is therefore inhibition of POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM_006235), a gene which is a transcriptional coactivator that specifically associates with either oct1 or oct2. Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU2AF1. The function of POU2AF1 has been established by previous studies. POU domain proteins contain a bipartite DNA-binding domain divided by a flexible linker that enables them to adopt various monomer configurations on DNA. The versatility of POU protein operation is additionally conferred at the dimerization level. Tomilin et al. (2000) found that the POU

dimer from the OCT1 gene formed on the palindromic OCT factor recognition element, or PORE (ATTTGAAATGCAAAT), could recruit the transcriptional coactivator OBF1, whereas POU dimers formed on the consensus MORE (more PORE) (ATGCATATGCAT) or on MOREs from Ig heavy chain promoters (AT[G/A][C/A]ATATGCAA) failed to interact. An interaction with OBF1 was precluded since the same OCT1 residues that form the MORE dimerization interface are also used for OBF1/OCT1 interactions on the PORE. These findings provided a paradigm of how specific POU dimer assemblies can differentially recruit a coregulatory activity with distinct transcriptional readouts. Animal model experiments lend further support to the function of POU2AF1. Schubart et al. (2001) noted that Oct2-deficient mice die at birth but have normal B-cell development and transcription of Ig genes. Obf1-deficient mice are viable with unaffected B-cell development in bone marrow and normal serum IgM but have reduced B-cell numbers in spleen and low serum IgG. By creating double knockout mice, Schubart et al. (2001) confirmed that B-cell development and Ig gene transcription can proceed normally without these B-cell specific factors. However, in these animals

the mature B-cell pool was strongly reduced, suggesting that these factors play an important role in controlling the expansion and/or maintenance of mature B cells.

[11516] It is appreciated that the abovementioned animal model for POU2AF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[11517] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11518] Schubart, K.; Massa, S.; Schubart, D.; Corcoran, L. M.; Rolink, A. G.; Matthias, P. : B cell development and immunoglobulin gene transcription in the absence of Oct-2 and OBF-1. *Nature Immun.* 2: 69-74, 2001. ; and

[11519] Tomilin, A.; Remenyi, A.; Lins, K.; Bak, H.; Leidel, S.; Vriend, G.; Wilmanns, M.; Scholer, H. R. : Synergism with the coactivator OBF-1 (OCA-B, BOB-1) is mediated by a specific POU dimer.

[11520] Further studies establishing the function and utilities of POU2AF1 are found in John Hopkins OMIM database record ID 601206, and in cited publications numbered 6375-6377, 6882, 10799-688 and 10797 listed in the bibliography section hereinbelow, which are also hereby

incorporated by reference. KIAA1950 (Accession XM_166532) is another VGAM171 host target gene. KIAA1950 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1950 BINDING SITE, designated SEQ ID:44492, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:2882.

[11521] Another function of VGAM171 is therefore inhibition of KIAA1950 (Accession XM_166532). Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950. MGC2647 (Accession XM_057150) is another VGAM171 host target gene. MGC2647 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2647, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2647 BINDING SITE, designated SEQ ID:36485, to the nucleotide

sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:2882.

[11522] Another function of VGAM171 is therefore inhibition of MGC2647 (Accession XM_057150). Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2647. RTC Domain Containing 1 (RTCD1, Accession NM_003729) is another VGAM171 host target gene. RTCD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RTCD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RTCD1 BINDING SITE, designated SEQ ID:9822, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:2882.

[11523] Another function of VGAM171 is therefore inhibition of RTC Domain Containing 1 (RTCD1, Accession NM_003729). Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RTCD1. SCMH1 (Accession NM_012236) is another VGAM171 host target gene.

SCMH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCMH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCMH1 BINDING SITE, designated SEQ ID:14540, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ ID:2882.

[11524] Another function of VGAM171 is therefore inhibition of SCMH1 (Accession NM_012236). Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCMH1. Tripartite Motif-containing 22 (TRIM22, Accession NM_006074) is another VGAM171 host target gene. TRIM22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM22 BINDING SITE, designated SEQ ID:12718, to the nucleotide sequence of VGAM171 RNA, herein designated VGAM RNA, also designated SEQ

ID:2882.

- [11525] Another function of VGAM171 is therefore inhibition of Tripartite Motif-containing 22 (TRIM22, Accession NM_006074). Accordingly, utilities of VGAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM22. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 172 (VGAM172) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [11526] VGAM172 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM172 was detected is described hereinabove with reference to Figs. 1–8.
- [11527] VGAM172 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM172 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [11528] VGAM172 gene encodes a VGAM172 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM172 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM172 precursor RNA is designated SEQ ID:158, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:158 is located at position 101644 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11529] VGAM172 precursor RNA folds onto itself, forming VGAM172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11530] An enzyme complex designated DICER COMPLEX, `dices` the VGAM172 folded precursor RNA into VGAM172 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM172 RNA is designated SEQ ID:2883, and is provided hereinbelow with reference to the sequence listing part.

[11531] VGAM172 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM172 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM172 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[11532] VGAM172 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM172 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM172 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM172 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM172 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11533] The complementary binding of VGAM172 RNA, herein designated VGAM RNA, to host target binding sites on VGAM172 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM172 host target RNA into VGAM172 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11534] It is appreciated that VGAM172 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM172 host target genes. The mRNA of each one of this plurality of VGAM172 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM172 RNA, herein designated VGAM RNA, and which when bound by VGAM172 RNA causes inhibition of translation of respective one or more VGAM172 host target proteins.

[11535] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM172 gene, herein designated VGAM GENE, on one or more VGAM172 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[11536] It is yet further appreciated that a function of VGAM172 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM172 correlate with, and may be deduced from, the identity of the host target genes which VGAM172 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11537] Nucleotide sequences of the VGAM172 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM172 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM172 are further described hereinbelow with reference to Table 1.

[11538] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM172 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM172 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11539] As mentioned hereinabove with reference to Fig. 1, a function of VGAM172 gene, herein designated VGAM is inhibition of expression of VGAM172 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM172 correlate with, and may be deduced from, the identity of the target genes which VGAM172 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11540] Alpha-1-B Glycoprotein (A1BG, Accession NM_130786) is a VGAM172 host target gene. A1BG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by A1BG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of A1BG BINDING SITE, designated SEQ ID:28277, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11541] A function of VGAM172 is therefore inhibition of Alpha-

1-B Glycoprotein (A1BG, Accession NM_130786), a gene which a plasma protein of unknown function. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A1BG. The function of A1BG has been established by previous studies. The complete amino acid sequence of alpha-1B-glycoprotein, a plasma protein of unknown function, was determined by Ishioka et al. (1986). Sequence homology to immunoglobulins was recognized. Alpha-1B-glycoprotein is present in normal adult plasma at an average concentration of 22 mg/dl. Gahne et al. (1987) observed genetic polymorphism of A1B using one-dimensional horizontal polyacrylamide gel electrophoresis followed by Western blotting with specific antiserum. Three different phenotypes, designated 1-1, 1-2, and 2-2, were observed. Family data supported the hypothesis that the three phenotypes are determined by 2 codominant alleles at an autosomal locus. In pigs the homologous locus is linked to malignant hyperthermia (OMIM Ref. No. 145600). Several other linkages in pigs and in horses suggest that human chromosomes 19, 6, and 1 are 'candidate chromosomes' for bearing the human A1B. Juneja et al. (1988) found a higher degree of A1B polymorphism in

American blacks than in Caucasian populations. They described new alleles. Eiberg et al. (1989) reported exclusion data for localization of the alpha-1B-glycoprotein gene polymorphism. Eiberg et al. (1989) found linkage between A1BG and Lutheran blood group (OMIM Ref. No. 111150); lod = 3.06 at theta = 0.05 in males, and lod = 1.42 at theta = 0.10 in females. They suggested that the most likely order of genes on chromosome 19 is C3--SE--LU--A1BG.

[11542] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11543] Ishioka, N.; Takahashi, N.; Putnam, F. W. : Amino acid sequence of human plasma alpha-1B-glycoprotein: homology to the immunoglobulin supergene family. Proc. Nat. Acad. Sci. 83: 2363-2367, 1986. ; and

[11544] Eiberg, H.; Bisgaard, M. L.; Mohr, J. : Linkage between alpha-1-B-glycoprotein (A1BG) and Lutheran (LU) red blood group system: assignment to chromosome 19: new genetic variants of A1BG.

[11545] Further studies establishing the function and utilities of A1BG are found in John Hopkins OMIM database record ID 138670, and in cited publications numbered

12027–12031 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Aconitase 1, Soluble (ACO1, Accession NM_002197) is another VGAM172 host target gene. ACO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACO1 BINDING SITE, designated SEQ ID:7955, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11546] Another function of VGAM172 is therefore inhibition of Aconitase 1, Soluble (ACO1, Accession NM_002197), a gene which an iron-dependent enzyme; catalyzes conversion of citrate to cis-aconitate in the TCA cycle. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACO1. The function of ACO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53. A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession NM_007203) is another VGAM172

host target gene. AKAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AKAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP2 BINDING SITE, designated SEQ ID:14065, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11547] Another function of VGAM172 is therefore inhibition of A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession NM_007203), a gene which binds to regulatory subunit (rii) of protein kinase a. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP2. The function of AKAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18.Cockayne Syndrome 1 (classical) (CKN1, Accession NM_000082) is another VGAM172 host target gene. CKN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CKN1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKN1 BINDING SITE, designated SEQ ID:5534, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11548] Another function of VGAM172 is therefore inhibition of Cockayne Syndrome 1 (classical) (CKN1, Accession NM_000082). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKN1. Fatty-acid-Coenzyme A Ligase, Long-chain 2 (FACL2, Accession NM_021122) is another VGAM172 host target gene. FACL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FACL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACL2 BINDING SITE, designated SEQ ID:22097, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11549] Another function of VGAM172 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 2 (FACL2, Ac-

cession NM_021122), a gene which activates long-chain fatty acids for both synthesis of cellular lipids. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL2. The function of FACL2 has been established by previous studies. See 152425. Minoshima et al. (1991) isolated a human cDNA for a long-chain acyl-CoA synthetase from a human liver cDNA library using the rat cDNA as a probe. Using flow-sorted human chromosomes, they demonstrated that the gene, now designated FACL2, is located on human chromosome 4. Cantu et al. (1995) mapped FACL2 to 4q34-q35 by fluorescence in situ hybridization.

[11550] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11551] Cantu, E. S.; Sprinkle, T. J.; Ghosh, B.; Singh, I. : The human palmitoyl-CoA ligase (FACL2) gene maps to the chromosome 4q34-q35 region by fluorescence in situ hybridization (FISH) and somatic cell hybrid panels. *Genomics* 28: 600-602, 1995. ; and

[11552] Minoshima, S.; Fukuyama, R.; Yamamoto, T.; Shimizu, N. : Mapping of human long-chain acyl-CoA synthetase to

chromosome 4. (Abstract) Cytogenet. Cell Genet. 58: 1888 only, 1991.

[11553] Further studies establishing the function and utilities of FACL2 are found in John Hopkins OMIM database record ID 152426, and in cited publications numbered 3434 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Four and A Half LIM Domains 2 (FHL2, Accession NM_001450) is another VGAM172 host target gene. FHL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FHL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHL2 BINDING SITE, designated SEQ ID:7182, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11554] Another function of VGAM172 is therefore inhibition of Four and A Half LIM Domains 2 (FHL2, Accession NM_001450), a gene which Contains four LIM domains and an additional zinc finger. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHL2. The

function of FHL2 has been established by previous studies. LIM proteins contain a highly conserved double zinc finger motif called the LIM domain. By searching sequence databases with a partial human SLIM1 (FHL1; 300163) cDNA, Morgan and Madgwick (1996) identified partial SLIM3 cDNAs. Genini et al. (1997) used subtractive cloning to isolate a gene that is downregulated during transformation of normal myoblasts to rhabdomyosarcoma cells. The gene, termed DRAL for 'down-regulated in rhabdomyosarcoma LIM protein,' encodes a 279-amino acid polypeptide with an observed mass of 32 kD. The protein sequence contains 4 complete LIM domains and the second half of a fifth LIM domain. DRAL appears to be a member of the LIM-only class of proteins, which consist primarily of LIM domains and little else. Southern blotting revealed a single-copy gene that is conserved among vertebrates. Northern blotting revealed that the DRAL gene is expressed at highest levels in heart and ovary, and at lower levels in skeletal muscle, prostate, testis, small intestine, and colon. Results of Northern blotting of tumor cell lines suggested to Genini et al. (1997) that this gene may be downregulated during transformation of a variety of cell types. Genini et al. (1997) used in situ hybridization

to map the human FHL2 gene to 2q12–q14. By fluorescence in situ hybridization, Chan et al. (1998) mapped the FHL2 gene to 2q12–q13. Using the yeast 2–hybrid system, Tanahashi and Tabira (2000) screened for proteins interacting with an Alzheimer disease gene, presenilin–2 (OMIM Ref. No. 600759), and cloned DRAL. DRAL interacted with a hydrophilic loop region (amino acids 269–298) in the endoproteolytic N–terminal fragment of PS2, but not that of PS1 (OMIM Ref. No. 104311), although residues 269 to 298 of PS2 and the corresponding PS1 sequence differ by only 3 amino acids. Each of 9 PS2 point mutations within a region from residues 275 to 296 abolished the binding. The in vitro interaction was confirmed by affinity column assay and the physiologic interactions between endogenous PS2 and DRAL by coimmunoprecipitation from human lung fibroblast MRC5 cells. The authors suggested that DRAL functions as a link between PS2 and an intracellular signaling pathway.

[11555] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11556] Genini, M.; Schwalbe, P.; Scholl, F. A.; Remppis, A.; Mattei, M.–G.; Schafer, B. W. : Subtractive cloning and characteri–

zation of DRAL, a novel LIM-domain protein down-regulated in rhabdomyosarcoma. DNA Cell Biol. 16: 433-442, 1997. ; and

[11557] Tanahashi, H.; Tabira, T. : Alzheimer's disease-associated presenilin 2 interacts with DRAL, an LIM-domain protein. Hum. Molec. Genet. 9: 2281-2289, 2000.

[11558] Further studies establishing the function and utilities of FHL2 are found in John Hopkins OMIM database record ID 602633, and in cited publications numbered 8751-875 and 11005 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hermansky-Pudlak Syndrome 1 (HPS1, Accession NM_000195) is another VGAM172 host target gene. HPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPS1 BINDING SITE, designated SEQ ID:5696, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11559] Another function of VGAM172 is therefore inhibition of Hermansky-Pudlak Syndrome 1 (HPS1, Accession

NM_000195). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS1. Mannosidase, Alpha, Class 1A, Member 1 (MAN1A1, Accession XM_166312) is another VGAM172 host target gene. MAN1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAN1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN1A1 BINDING SITE, designated SEQ ID:44135, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11560] Another function of VGAM172 is therefore inhibition of Mannosidase, Alpha, Class 1A, Member 1 (MAN1A1, Accession XM_166312), a gene which removes 3 distinct mannose residues from peptide-bound Man(9)-GlcNAc(2) oligosaccharides. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN1A1. The function of MAN1A1 has been established by previous studies. Man(9)-mannosidase (alpha-1,2-mannosidase 1A) catalyzes the removal of 3 distinct mannose residues from

peptide-bound Man(9)–GlcNAc(2) oligosaccharides. See MAN2A1 (OMIM Ref. No. 154582) for general information. Using an oligonucleotide probe derived from a pig liver Man(9)–mannosidase–specific cDNA template, Bause et al. (1993) isolated Man(9)–mannosidase from a human kidney cDNA library. The full-length cDNA predicted a 625–amino acid protein with a calculated molecular mass of 71 kD. Man(9)–mannosidase is a type II transmembrane protein with a short cytoplasmic polypeptide tail, a single transmembrane domain acting as a noncleavable signal sequence, a large luminal catalytic domain, and 3 potential N–glycosylation sites

[11561] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11562] Bause, E.; Bieberich, E.; Rolfs, A.; Volker, C.; Schmidt, B. : Molecular cloning and primary structure of Man(9)–mannosidase from human kidney. *Eur. J. Biochem.* 217: 535–540, 1993. ; and

[11563] Tremblay, L. O; Campbell Dyke, N.; Herscovics, A. : Molecular cloning, chromosomal mapping and tissue–specific expression of a novel human alpha–1,2–mannosidase gene involved in N–glycan.

[11564] Further studies establishing the function and utilities of MAN1A1 are found in John Hopkins OMIM database record ID 604344, and in cited publications numbered 4991–4992 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Presenilin 1 (Alzheimer disease 3) (PSEN1, Accession NM_007318) is another VGAM172 host target gene. PSEN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PSEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSEN1 BINDING SITE, designated SEQ ID:14236, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11565] Another function of VGAM172 is therefore inhibition of Presenilin 1 (Alzheimer disease 3) (PSEN1, Accession NM_007318). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSEN1. Solute Carrier Family 25 (mitochondrial carrier; ornithine transporter) Member 15 (SLC25A15, Accession NM_014252) is another VGAM172 host target gene. SLC25A15 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC25A15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC25A15 BINDING SITE, designated SEQ ID:15527, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11566] Another function of VGAM172 is therefore inhibition of Solute Carrier Family 25 (mitochondrial carrier; ornithine transporter) Member 15 (SLC25A15, Accession NM_014252), a gene which participates the ornithine transport across inner mitochondrial membrane, from the cytoplasm to the matrix. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC25A15. The function of SLC25A15 has been established by previous studies. The urea cycle is an example of metabolic homeostasis, maintaining concentrations of a toxic metabolite, ammonium ions, in a narrow, tolerable range despite more than 10-fold variations in dietary intake of its precursor, nitrogen. Five enzymes in 2 subcellular compartments (mitochondrial matrix and cytosol) ac-

comply with this feat. Another vital component of the urea cycle is the transporter required to move ornithine across the inner mitochondrial membrane from cytosol to mitochondrial matrix. This is the transporter that is defective in hyperornithinemia–hyperammonemia–homocitrullinuria (HHH syndrome; 238970). *Neurospora crassa* ARG13 and *Saccharomyces cerevisiae* ARG11 encode mitochondrial carrier family proteins that transport ornithine across the mitochondrial inner membrane. Camacho et al. (1999) used their sequences to identify EST candidates derived from genes that encode orthologous mammalian transporters. They thereby identified a gene, ORNT1, that maps to 13q14 and whose expression, similar to that of other urea cycle components, was high in liver and varied with changes in dietary protein. ORNT1 expression restored ornithine metabolism in fibroblasts from patients with HHH syndrome. They found that the ORNT1 gene encodes a 301-residue protein with 95% identity to mouse Ornt1 and 28% identity to *Neurospora* ARG13. Expression of either murine or human ORNT1 restored normal ornithine metabolism in HHH fibroblasts. The protein localized to mitochondria. In a survey of 11 HHH probands, Camacho et al. (1999) identified 3 ORNT1 mutant alleles that ac-

counted for 21 of 22 possible mutant ORNT1 genes in these patients

[11567] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11568] Camacho, J. A.; Obie, C.; Biery, B.; Goodman, B. K.; Hu, C.-A.; Almashanu, S.; Steel, G.; Casey, R.; Lambert, M.; Mitchell, G. A.; Valle, D. : Hyperornithinaemia-hyperammonaemia-homocitrullinuria syndrome is caused by mutations in a gene encoding a mitochondrial ornithine transporter. Nature Genet. 22: 151–158, 1999. ; and

[11569] Tsujino, S.; Kanazawa, N.; Ohashi, T.; Eto, Y.; Saito, T.; Kira, J.; Yamada, T. : Three novel mutations (G27E, in-sAAC, R179X) in the ORNT1 gene of Japanese patients with hyperornithinemia.

[11570] Further studies establishing the function and utilities of SLC25A15 are found in John Hopkins OMIM database record ID 603861, and in cited publications numbered 9450–7424 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Syntrophin, Beta 2 (dystrophin-associated protein A1, 59kDa, basic component 2) (SNTB2, Accession NM_130845) is another VGAM172 host target gene.

SNTB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNTB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNTB2 BINDING SITE, designated SEQ ID:28380, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11571] Another function of VGAM172 is therefore inhibition of Syntrophin, Beta 2 (dystrophin-associated protein A1, 59kDa, basic component 2) (SNTB2, Accession NM_130845). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNTB2. T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession NM_003189) is another VGAM172 host target gene. TAL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAL1 BINDING SITE, designated SEQ ID:9176, to the nucleotide se-

quence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11572] Another function of VGAM172 is therefore inhibition of T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession NM_003189), a gene which may help control cell growth and differentiation. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAL1. The function of TAL1 has been established by previous studies. Finger et al. (1989) analyzed a t(1;14)(p32;q11) chromosomal translocation in a lymphohemopoietic stem cell line derived from a patient with acute T-lymphoblastic leukemia (Kurtzberg et al., 1985). The chromosomal joining of 14 to 1p occurred at the T-cell receptor delta diversity (D-delta-2) segment, and the reciprocal joining on chromosome 14 occurred at the T-cell delta diversity segment D-delta-1. Involvement of delta diversity segments at the translocation junctions suggested that the translocation occurred during an attempt at delta-1/delta-2 joining in a stem cell. Finger et al. (1989) found that the segment of chromosome 1 at band p32, adjacent to the chromosomal breakpoint, encodes a transcriptional unit designated TCL5. Finger et al. (1989) also demonstrated a rearrange-

ment of the TCL5 locus in a human melanoma cell line carrying a deletion at 1p32. The occurrence of 'biphenotypic' leukemias with lymphoid and myeloid characteristics and evidence of stem cell origin of myeloid, erythroid, megakaryocytic, and lymphoid lineages in chronic myeloid leukemia suggested that leukemias may arise from pluripotent hematopoietic cells. Begley et al. (1989) studied a leukemic stem cell line that was capable of differentiating into either myeloid or lymphoid cells and that carried a translocation between chromosomes 1 and 14, t(1;14)(p33;q11). By means of molecular cloning and sequencing, they showed that as a consequence of the translocation an unusual fusion transcript was generated. The chromosome 1 region involved in the breakpoint was the site of transcriptional activity apparently occurring only in hematopoietic tissues. Begley et al. (1989) concluded that the translocation may identify a gene located on chromosome 1 which is important for hematopoietic development and oncogenesis. They suggested the designation SCL (stem cell leukemia hematopoietic transcription factor).

[11573] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [11574] Begley, C. G.; Aplan, P. D.; Davey, M. P.; Nakahara, K.; Tchorz, K.; Kurtzberg, J.; Hershfield, M. S.; Haynes, B. F.; Cohen, D. I.; Waldmann, T. A.; Kirsch, I. R. : Chromosomal translocation in a human leukemic stem-cell line disrupts the T-cell antigen receptor delta-chain diversity region and results in a previously unreported fusion transcript. Proc. Nat. Acad. Sci. 86: 2031-2035, 1989. ; and
- [11575] Finger, L. R.; Kagan, J.; Christopher, G.; Kurtzberg, J.; Hershfield, M. S.; Nowell, P. C.; Croce, C. M. : Involvement of the TCL5 gene on human chromosome 1 in T-cell leukemia and mel.
- [11576] Further studies establishing the function and utilities of TAL1 are found in John Hopkins OMIM database record ID 187040, and in cited publications numbered 12610, 1261 and 2510-2521 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transcription Factor-like 4 (TCFL4, Accession XM_032817) is another VGAM172 host target gene. TCFL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of TCFL4 BINDING SITE, designated SEQ ID:31772, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11577] Another function of VGAM172 is therefore inhibition of Transcription Factor-like 4 (TCFL4, Accession XM_032817), a gene which interacts with Mad and represses transcription by recruiting the Sin3A-histone deacetylase corepressor complex. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCFL4. The function of TCFL4 has been established by previous studies. Members of the basic helix-loop-helix leucine zipper (bHLH-Zip) family are transcription factors with roles in proliferation, determination, and differentiation (e.g., MAX; 154950). By searching sequence databases with a mouse Tcfl4 cDNA, Bjerknes and Cheng (1996) identified several TCFL4 expressed sequence tags derived from a variety of human tissues, and a 46-kb cosmid clone (GenBank U34879) containing the human TCFL4 gene. This cosmid, which maps to 17q21.1, also contains the HSD17B1 gene (OMIM Ref. No. 109684). The TCFL4 gene has 8 exons and spans more than 5 kb. The pre-

dicted TCFL4 protein contains a basic helix–loop–helix domain and a leucine zipper domain. RT–PCR detected mouse Tcfl4 expression in all tissues examined. In a 2–hybrid screen to identify Mad1 (OMIM Ref. No. 602686)–interacting proteins, Billin et al. (1999) identified TCFL4 as MLX, a bHLH–Zip protein that is structurally and functionally related to MAX. The predicted amino acid sequence of MLX is conserved at all positions that define the bHLH–Zip class of transcription factors and is most similar to that of MAX, sharing approximately 50% identity in the bHLH–Zip domains. The 244–amino acid human and mouse MLX proteins differ at only 4 amino acid positions. Billin et al. (1999) showed that transcriptional repression by Mad1:MLX heterodimers is dependent on dimerization, DNA binding, and recruitment of the Sin3A–histone deacetylase (see OMIM Ref. No. 601241) corepressor complex. Their findings suggested that MLX may act to diversify Mad family function by its restricted association with a subset of the Mad family of transcriptional repressors.

[11578] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [11579] Billin, A. N.; Eilers, A. L.; Queva, C.; Ayer, D. E. : Mlx, a novel Max-like BHLHZip protein that interacts with the Max network of transcription factors. *J. Biol. Chem.* 274: 36344–36350, 1999. ; and
- [11580] Bjerknes, M.; Cheng, H. : TCFL4: a gene at 17q21.1 encoding a putative basic helix–loop–helix leucine–zipper transcription factor. *Gene* 181: 7–11, 1996.
- [11581] Further studies establishing the function and utilities of TCFL4 are found in John Hopkins OMIM database record ID 602976, and in cited publications numbered 8541–8543 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is another VGAM172 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15356, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.
- [11582] Another function of VGAM172 is therefore inhibition of

Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 has been established by previous studies. Trichorhinophalangeal syndrome type I (OMIM Ref. No. 190350) is a malformation syndrome characterized by distinctive craniofacial and skeletal abnormalities and is inherited as an autosomal dominant. TRPS I patients have sparse scalp hair, bulbous tip of the nose, long flat philtrum, thin upper vermilion border, and protruding ears. Skeletal abnormalities include cone-shaped epiphyses at the phalanges, hip malformations, and short stature. Ludecke et al. (1995) and Hou et al. (1995) assigned the TRPS1 gene to 8q24. It maps centromeric to the gene that is mutant in multiple exostoses type I (EXT1; 133700); EXT1 is deleted in all patients with TRPS type II, or Langer-Giedion syndrome (OMIM Ref. No. 150230), which combines features of TRPS I and multiple exostoses. Momeni et al. (2000) positionally cloned a gene that spanned the chromosomal breakpoint in 2 patients with TRPS I and was deleted in 5 patients with TRPS I associ-

ated with an interstitial deletion. Northern blot analyses revealed transcripts of 7 and 10.5 kb. The gene, designated TRPS1, has 7 exons and encodes a polypeptide of 1,281 amino acids. The predicted protein sequence has 2 potential nuclear localization signals and an unusual combination of different zinc finger motifs, including IKAROS-like (see OMIM Ref. No. 603023) and GATA-binding (see OMIM Ref. No. 600576) sequences. Momeni et al. (2000) identified 6 different nonsense mutations in 10 unrelated patients. The findings suggested that haploinsufficiency for this putative transcription factor causes TRPS I. To investigate whether trichorhinophalangeal syndrome type III (OMIM Ref. No. 190351) is caused by TRPS1 mutations and to establish a genotype-phenotype correlation in TRPS, Ludecke et al. (2001) performed extensive mutation analysis and evaluated height and degree of brachydactyly in patients with TRPS I or TRPS III. They found 35 different mutations in 44 of 51 unrelated patients. The detection rate (86%) indicated that TRPS1 is the major locus for TRPS I and TRPS III. They found no mutation in the parents of sporadic patients or in apparently healthy relatives of familial patients, indicating complete penetrance of TRPS1 mutations. Evaluation of skeletal abnormalities of patients

with TRPS1 mutations revealed a wide clinical spectrum. The phenotype was variable in unrelated, age- and sex-matched patients with identical mutations, as well as in families. Four of the 5 missense mutations altered the GATA DNA-binding zinc finger, and 6 of the 7 unrelated patients with these mutations could be classified as having TRPS III, because they had severe bradycardia, due to short metacarpals, and severe short stature. The data indicated that TRPS III is at the severe end of the TRPS spectrum and that it is most often caused by a specific class of mutations in exon 6 the TRPS1 gene. In the study of Ludecke et al. (2001), 5 mutations were recurrent, and 4 of these were identified in patients of different ethnicities: 1 in patients of Norwegian, Turkish, and Belgian extraction, and another in patients of Belgian, Turkish, and Japanese extraction, for example.

[11583] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11584] Momeni, P.; Glockner, G.; Schmidt, O.; von Holtum, D.; Albrecht, B.; Gillessen-Kaesbach, G.; Hennekam, R.; Meinecke, P.; Zabel, B.; Rosenthal, A.; Horsthemke, B.; Ludecke, H.-J. : Mutations in a new gene, encoding a zinc-

finger protein, cause tricho-rhino-phalangeal syndrome type I. Nature Genet. 24: 71-74, 2000. ; and

[11585] Ludecke, H.-J.; Schaper, J.; Meinecke, P.; Momeni, P.; Gross, S.; von Holtum, D.; Hirche, H.; Abramowicz, M. J.; Albrecht, B.; Apacik, C.; Christen, H.-J.; Claussen, U.; and 28 others : G.

[11586] Further studies establishing the function and utilities of TRPS1 are found in John Hopkins OMIM database record ID 604386, and in cited publications numbered 7077-7078, 3619, 7945, 1268 and 12627 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 202 (ZNF202, Accession NM_003455) is another VGAM172 host target gene. ZNF202 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF202 BINDING SITE, designated SEQ ID:9512, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11587] Another function of VGAM172 is therefore inhibition of

Zinc Finger Protein 202 (ZNF202, Accession NM_003455). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF202. ARAP3 (Accession NM_022481) is another VGAM172 host target gene. ARAP3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARAP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARAP3 BINDING SITE, designated SEQ ID:22856, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11588] Another function of VGAM172 is therefore inhibition of ARAP3 (Accession NM_022481). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARAP3. Bromodomain Containing 4 (BRD4, Accession NM_014299) is another VGAM172 host target gene. BRD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of BRD4 BINDING SITE, designated SEQ ID:15596, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11589] Another function of VGAM172 is therefore inhibition of Bromodomain Containing 4 (BRD4, Accession NM_014299). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD4. Chromosome 8 Open Reading Frame 2 (C8orf2, Accession NM_007175) is another VGAM172 host target gene. C8orf2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf2 BINDING SITE, designated SEQ ID:14026, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11590] Another function of VGAM172 is therefore inhibition of Chromosome 8 Open Reading Frame 2 (C8orf2, Accession NM_007175). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with C8orf2. FBP17 (Accession XM_052666) is another VGAM172 host target gene. FBP17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBP17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBP17 BINDING SITE, designated SEQ ID:36051, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11591] Another function of VGAM172 is therefore inhibition of FBP17 (Accession XM_052666). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBP17. FLJ00007 (Accession XM_048928) is another VGAM172 host target gene. FLJ00007 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00007 BINDING SITE, designated SEQ ID:35316, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2883.

[11592] Another function of VGAM172 is therefore inhibition of FLJ00007 (Accession XM_048928). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00007. FLJ14957 (Accession NM_032866) is another VGAM172 host target gene. FLJ14957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14957 BINDING SITE, designated SEQ ID:26686, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11593] Another function of VGAM172 is therefore inhibition of FLJ14957 (Accession NM_032866). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14957. FLJ31101 (Accession NM_017964) is another VGAM172 host target gene. FLJ31101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31101, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31101 BINDING SITE, designated SEQ ID:19689, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11594] Another function of VGAM172 is therefore inhibition of FLJ31101 (Accession NM_017964). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31101. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_015044) is another VGAM172 host target gene. GGA2 BINDING SITE1 and GGA2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GGA2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE1 and GGA2 BINDING SITE2, designated SEQ ID:17406 and SEQ ID:28928 respectively, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11595] Another function of VGAM172 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_015044). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2. GTP Binding Protein 1 (GTPBP1, Accession NM_004286) is another VGAM172 host target gene. GTPBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTPBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTPBP1 BINDING SITE, designated SEQ ID:10499, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11596] Another function of VGAM172 is therefore inhibition of GTP Binding Protein 1 (GTPBP1, Accession NM_004286). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBP1. KIAA0711 (Accession NM_014867) is another VGAM172 host target gene. KIAA0711 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by KIAA0711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0711 BINDING SITE, designated SEQ ID:16959, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11597] Another function of VGAM172 is therefore inhibition of KIAA0711 (Accession NM_014867). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0711. KIAA0775 (Accession NM_014726) is another VGAM172 host target gene. KIAA0775 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0775 BINDING SITE, designated SEQ ID:16323, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11598] Another function of VGAM172 is therefore inhibition of

KIAA0775 (Accession NM_014726). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0775. KIAA1538 (Accession XM_049474) is another VGAM172 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35438, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11599] Another function of VGAM172 is therefore inhibition of KIAA1538 (Accession XM_049474). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. KIAA1559 (Accession XM_054472) is another VGAM172 host target gene. KIAA1559 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1559 BINDING SITE, designated SEQ ID:36167, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11600] Another function of VGAM172 is therefore inhibition of KIAA1559 (Accession XM_054472). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1559. KIAA1822 (Accession XM_041566) is another VGAM172 host target gene. KIAA1822 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1822 BINDING SITE, designated SEQ ID:33557, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11601] Another function of VGAM172 is therefore inhibition of KIAA1822 (Accession XM_041566). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1822. MGC21688 (Accession NM_144635) is another

VGAM172 host target gene. MGC21688 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC21688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21688 BINDING SITE, designated SEQ ID:29455, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11602] Another function of VGAM172 is therefore inhibition of MGC21688 (Accession NM_144635). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21688. MGC3101 (Accession NM_024043) is another VGAM172 host target gene. MGC3101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3101 BINDING SITE, designated SEQ ID:23476, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11603] Another function of VGAM172 is therefore inhibition of MGC3101 (Accession NM_024043). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3101. Retinoic Acid Induced 16 (RAI16, Accession NM_022749) is another VGAM172 host target gene. RAI16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAI16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI16 BINDING SITE, designated SEQ ID:22972, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11604] Another function of VGAM172 is therefore inhibition of Retinoic Acid Induced 16 (RAI16, Accession NM_022749). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI16. RDC1 (Accession XM_051522) is another VGAM172 host target gene. RDC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RDC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDC1 BINDING SITE, designated SEQ ID:35849, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11605] Another function of VGAM172 is therefore inhibition of RDC1 (Accession XM_051522). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDC1. RING1 and YY1 Binding Protein (RYBP, Accession XM_002853) is another VGAM172 host target gene. RYBP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RYBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RYBP BINDING SITE, designated SEQ ID:29909, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11606] Another function of VGAM172 is therefore inhibition of RING1 and YY1 Binding Protein (RYBP, Accession XM_002853). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with RYBP. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM_004263) is another VGAM172 host target gene. SEMA4F BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEMA4F, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4F BINDING SITE, designated SEQ ID:10462, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11607] Another function of VGAM172 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM_004263). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4F. SPEC1 (Accession NM_020239) is another VGAM172 host target gene. SPEC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPEC1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPEC1 BINDING SITE, designated SEQ ID:21513, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11608] Another function of VGAM172 is therefore inhibition of SPEC1 (Accession NM_020239). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPEC1. Tripartite Motif-containing 5 (TRIM5, Accession NM_033093) is another VGAM172 host target gene. TRIM5 BINDING SITE1 through TRIM5 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRIM5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM5 BINDING SITE1 through TRIM5 BINDING SITE3, designated SEQ ID:26937, SEQ ID:26927 and SEQ ID:26936 respectively, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11609] Another function of VGAM172 is therefore inhibition of

Tripartite Motif-containing 5 (TRIM5, Accession NM_033093). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM5. LOC115110 (Accession XM_049825) is another VGAM172 host target gene. LOC115110 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:35511, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11610] Another function of VGAM172 is therefore inhibition of LOC115110 (Accession XM_049825). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC127428 (Accession XM_059144) is another VGAM172 host target gene. LOC127428 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC127428, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127428 BINDING SITE, designated SEQ ID:36901, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11611] Another function of VGAM172 is therefore inhibition of LOC127428 (Accession XM_059144). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127428. LOC145662 (Accession XM_085194) is another VGAM172 host target gene. LOC145662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145662 BINDING SITE, designated SEQ ID:37919, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11612] Another function of VGAM172 is therefore inhibition of LOC145662 (Accession XM_085194). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145662. LOC146443 (Accession XM_085461) is another VGAM172 host target gene. LOC146443 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146443 BINDING SITE, designated SEQ ID:38150, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11613] Another function of VGAM172 is therefore inhibition of LOC146443 (Accession XM_085461). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146443. LOC149372 (Accession XM_086509) is another VGAM172 host target gene. LOC149372 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149372 BINDING SITE, designated SEQ ID:38731, to the nucleotide sequence of VGAM172 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2883.

[11614] Another function of VGAM172 is therefore inhibition of LOC149372 (Accession XM_086509). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149372. LOC151438 (Accession XM_098060) is another VGAM172 host target gene. LOC151438 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151438 BINDING SITE, designated SEQ ID:41348, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11615] Another function of VGAM172 is therefore inhibition of LOC151438 (Accession XM_098060). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151438. LOC151657 (Accession XM_098100) is another VGAM172 host target gene. LOC151657 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151657, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151657 BINDING SITE, designated SEQ ID:41383, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11616] Another function of VGAM172 is therefore inhibition of LOC151657 (Accession XM_098100). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151657. LOC151877 (Accession XM_098132) is another VGAM172 host target gene. LOC151877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151877 BINDING SITE, designated SEQ ID:41399, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11617] Another function of VGAM172 is therefore inhibition of LOC151877 (Accession XM_098132). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC151877. LOC157931 (Accession XM_098845) is another VGAM172 host target gene. LOC157931 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157931 BINDING SITE, designated SEQ ID:41906, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11618] Another function of VGAM172 is therefore inhibition of LOC157931 (Accession XM_098845). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157931. LOC205251 (Accession XM_119554) is another VGAM172 host target gene. LOC205251 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC205251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205251 BINDING SITE, designated SEQ ID:43589, to

the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11619] Another function of VGAM172 is therefore inhibition of LOC205251 (Accession XM_119554). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205251. LOC255177 (Accession XM_172941) is another VGAM172 host target gene. LOC255177 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255177 BINDING SITE, designated SEQ ID:46205, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11620] Another function of VGAM172 is therefore inhibition of LOC255177 (Accession XM_172941). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255177. LOC256021 (Accession XM_172884) is another VGAM172 host target gene. LOC256021 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC256021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256021 BINDING SITE, designated SEQ ID:46168, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11621] Another function of VGAM172 is therefore inhibition of LOC256021 (Accession XM_172884). Accordingly, utilities of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256021. LOC51301 (Accession NM_016591) is another VGAM172 host target gene. LOC51301 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51301 BINDING SITE, designated SEQ ID:18675, to the nucleotide sequence of VGAM172 RNA, herein designated VGAM RNA, also designated SEQ ID:2883.

[11622] Another function of VGAM172 is therefore inhibition of LOC51301 (Accession NM_016591). Accordingly, utilities

of VGAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 173 (VGAM173) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11623] VGAM173 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM173 was detected is described hereinabove with reference to Figs. 1–8.

[11624] VGAM173 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM173 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11625] VGAM173 gene encodes a VGAM173 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM173 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM173 precursor RNA is designated SEQ ID:159, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:159 is located at position 272848 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11626] VGAM173 precursor RNA folds onto itself, forming VGAM173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11627] An enzyme complex designated DICER COMPLEX, `dices` the VGAM173 folded precursor RNA into VGAM173 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM173 RNA is designated SEQ ID:2884, and is provided hereinbelow with reference to the sequence listing part.

[11628] VGAM173 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM173 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM173 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[11629] VGAM173 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM173 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM173 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM173 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM173 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[11630] The complementary binding of VGAM173 RNA, herein designated VGAM RNA, to host target binding sites on VGAM173 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM173 host target RNA into VGAM173 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11631] It is appreciated that VGAM173 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM173 host target genes. The mRNA of each one of this plurality of VGAM173 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM173 RNA, herein designated VGAM RNA, and which when bound by VGAM173 RNA causes inhibition of translation of respective one or more VGAM173 host target proteins.

[11632] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM173 gene, herein designated VGAM GENE, on one or more VGAM173 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11633] It is yet further appreciated that a function of VGAM173 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM173 correlate with, and may be deduced from, the identity of the host target genes which VGAM173 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11634] Nucleotide sequences of the VGAM173 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM173 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM173 are further described hereinbelow with reference to Table 1.

[11635] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM173 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM173 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[11636] As mentioned hereinabove with reference to Fig. 1, a function of VGAM173 gene, herein designated VGAM is inhibition of expression of VGAM173 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM173 correlate with, and may be deduced from, the identity of the target genes which VGAM173 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11637] Beta-site APP-cleaving Enzyme (BACE, Accession NM_012104) is a VGAM173 host target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BACE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, designated SEQ ID:14418 and SEQ ID:29086 respectively, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11638] A function of VGAM173 is therefore inhibition of Beta-site APP-cleaving Enzyme (BACE, Accession NM_012104), a

gene which is responsible for the proteolytic processing of the amyloid precursor protein. Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACE. The function of BACE has been established by previous studies. Cerebral deposition of amyloid beta peptide is an early and critical feature of Alzheimer disease (AD; 104300). Amyloid beta generation depends on proteolytic cleavage of amyloid precursor protein (APP; 104760) by 2 proteases, beta-secretase and gamma-secretase. Vassar et al. (1999) reported the cloning of a human transmembrane aspartic protease that had all the known characteristics of the beta-secretase. Using an expression cloning strategy, they identified a clone that shared significant sequence similarity with members of the pepsin subfamily of aspartic proteases. This clone encoded a novel protein, designated BACE for 'beta-site APP-cleaving enzyme.' The BACE open reading frame encodes a protein of 501 amino acids containing a 21-amino acid signal peptide followed by a proprotein domain spanning amino acids 22 to 45. The luminal domain of the mature protein is followed by 1 predicted transmembrane domain and a short cytosolic C-terminal tail of 24 amino acids. BACE was predicted to

be a type 1 transmembrane protein with the active site on the luminal side of the membrane, where beta-secretase cleaves APP. The BACE protein shares greatest amino acid identity (30%) with cathepsin E (OMIM Ref. No. 116890). Rat and mouse BACE orthologs have 96% amino acid sequence identity with the human BACE protein. Northern blot analysis of human BACE mRNA in adult peripheral tissues and various subregions of the brain detected 3 transcripts of approximately 7.0, 4.4, and 2.6 kb. By in situ hybridization, expression of BACE mRNA in rat brain was observed at higher levels in neurons than in glia, supporting the idea that neurons are the primary source of the extracellular A-beta deposited in amyloid plaques. Vassar et al. (1999) ascribed the difference between the apparent and calculated molecular weight (approximately 70 and 51 kD, respectively) of the BACE protein to N-linked glycosylation. Immunostaining demonstrated intracellular localization of BACE to the Golgi and endosomes. Transient overexpression of BACE did not affect APP expression, but decreased alpha-secretase cleavage and increased beta-secretase activity in cells expressing wildtype or Swedish mutant (104760.0008) APP. BACE overexpression induced cleavage only at the known beta-secretase positions, asp1

and glu11. Vassar et al. (1999) concluded that their data provided strong evidence that the BACE aspartic protease is the long-sought beta-secretase. Animal model experiments lend further support to the function of BACE. Luo et al. (2001) found that mice deficient in BACE1 are healthy, fertile, and appear normal in gross anatomy, tissue histology, hematology, and clinical chemistry. Bace1 -/- mice who are also hemizygous for an amyloid precursor protein transgene lack brain beta-amyloid and beta-secretase-cleaved APP C-terminal fragments. These results provided validation of BACE1 as the major beta-secretase in vivo and suggested that therapeutic inhibition of BACE1 for the treatment of Alzheimer disease may be free of mechanism-based toxicity.

[11639] It is appreciated that the abovementioned animal model for BACE is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[11640] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11641] Vassar, R.; Bennett, B. D.; Babu-Khan, S.; Kahn, S.; Mendiaz, E. A.; Dents, P.; Taplow, D. B.; Ross, S.; Amaranta, P.;

Loeloff, R.; Luo, Y.; Fisher, S.; and 12 others : Beta-secretase cleavage of Alzheimer's amyloid precursor protein by the transmembrane aspartic protease BACE. Science 286: 735–741, 1999. ; and

[11642] Luo, Y.; Bolon, B.; Kahn, S.; Bennett, B. D.; Babu-Khan, S.; Denis, P.; Fan, W.; Kha, H.; Zhang, J.; Gong, Y.; Martin, L.; Louis, J.-C.; Yan, Q.; Richards, W. G.; Citron, M.; Vassar, R.

[11643] Further studies establishing the function and utilities of BACE are found in John Hopkins OMIM database record ID 604252, and in cited publications numbered 5405, 5418–5422, 12307–7054, 7067, 7064–706 and 7068 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LIM Domain Kinase 1 (LIMK1, Accession NM_002314) is another VGAM173 host target gene. LIMK1 BINDING SITE1 and LIMK1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LIMK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK1 BINDING SITE1 and LIMK1 BINDING SITE2, designated SEQ ID:8124 and SEQ ID:18799 respectively, to the nucleotide sequence of VGAM173 RNA, herein designated

VGAM RNA, also designated SEQ ID:2884.

[11644] Another function of VGAM173 is therefore inhibition of LIM Domain Kinase 1 (LIMK1, Accession NM_002314). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK1. Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM_035037) is another VGAM173 host target gene. LRP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP4 BINDING SITE, designated SEQ ID:32198, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11645] Another function of VGAM173 is therefore inhibition of Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM_035037). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP4. Platelet-derived Growth Factor Beta Polypeptide (simian sarcoma viral (v-sis) Oncogene Homolog) (PDGFB, Accession

NM_002608) is another VGAM173 host target gene.

PDGFB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PDGFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFB BINDING SITE, designated SEQ ID:8469, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11646] Another function of VGAM173 is therefore inhibition of Platelet-derived Growth Factor Beta Polypeptide (simian sarcoma viral (v-sis) Oncogene Homolog) (PDGFB, Accession NM_002608), a gene which plays an important role in stimulating adjacent cells to grow and thereby heal the wound. Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFB. The function of PDGFB has been established by previous studies. Most proliferating cells are programmed to undergo apoptosis unless specific survival signals are provided. Platelet-derived growth factor promotes cellular proliferation and inhibits apoptosis. Romashkova and Makarov (1999) showed that PDGF activates the RAS/PIK3/AKT1/IKK/NFKB1 pathway. In this

pathway, NFKB1 (OMIM Ref. No. 164011) does not induce c-myc and apoptosis, but instead induces putative anti-apoptotic genes. In response to PDGF, AKT1 (OMIM Ref. No. 164730) transiently associates with IKK (see OMIM Ref. No. 600664) and induces IKK activation. The authors suggested that under certain conditions PIK3 (see OMIM Ref. No. 171834) may activate NFKB1 without the involvement of NFKBIA (OMIM Ref. No. 164008) or NFKBIB (OMIM Ref. No. 604495) degradation. Dermatofibrosarcoma protuberans (DFSP), an infiltrative skin tumor of intermediate malignancy, presents specific cytogenetic features such as reciprocal translocations t(17;22)(q22;q13) and supernumerary ring chromosomes derived from t(17;22). Simon et al. (1997) characterized the breakpoints from translocations and rings in dermatofibrosarcoma protuberans and its juvenile form, giant cell fibroblastoma, on the genomic and RNA levels. They found that these rearrangements fuse the PDGFB gene and the COL1A1 gene (OMIM Ref. No. 120150). Simon et al. (1997) commented that PDGFB has transforming activity and is a potent mitogen for a number of cell types, but its role in oncogenic processes was not fully understood. They noted that neither COL1A1 nor PDGFB had hitherto been implicated in tumor translo-

cations. The gene fusions deleted exon 1 of PDGFB and released this growth factor from its normal regulation; see 190040.0002.

[11647] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11648] Simon, M.-P.; Pedeutour, F.; Sirvent, N.; Grosgeorge, J.; Minoletti, F.; Coindre, J.-M.; Terrier-Lacombe, M.-J.; Mandahl, N.; Craver, R. D.; Blin, N.; Sozzi, G.; Turc-Carel, C.; O'Brien, K. P.; Kedra, D.; Fransson, I.; Guilbaud, C.; Dumanski, J. P. : Deregulation of the platelet-derived growth factor B-chain gene via fusion with collagen gene COL1A1 in dermatofibrosarcoma protuberans and giant-cell fibroblastoma. *Nature Genet.* 15: 95-98, 1997. ; and

[11649] Josephs, S. F.; Guo, C.; Ratner, L.; Wong-Staal, F. : Human proto-oncogene nucleotide sequences corresponding to the transforming region of simian sarcoma virus. *Science* 223: 487-491, 1983.

[11650] Further studies establishing the function and utilities of PDGFB are found in John Hopkins OMIM database record ID 190040, and in cited publications numbered 10481-10491, 9741, 9745-9747, 10094-9750, 3292-3294, 9751-9753, 3533, 9754-9758, 12740,

9764, 11491, 976 and 10480 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Smcx Homolog, X Chromosome (mouse) (SMCX, Accession NM_004187) is another VGAM173 host target gene. SMCX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMCX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMCX BINDING SITE, designated SEQ ID:10395, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11651] Another function of VGAM173 is therefore inhibition of Smcx Homolog, X Chromosome (mouse) (SMCX, Accession NM_004187), a gene which escapes X inactivation. Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCX. The function of SMCX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60. Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6,

Accession NM_017662) is another VGAM173 host target gene. TRPM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:19198, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11652] Another function of VGAM173 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM_017662), a gene which contains a predicted ion channel domain and a protein kinase domain. Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM6. The function of TRPM6 has been established by previous studies. Schlingmann et al. (2002) and Walder et al. (2002) studied hypomagnesemia with secondary hypocalcemia (HSH; 602014), which maps to 9q22, and by positional cloning identified the TRPM6 gene as the site of causative mutations. Walder et al. (2002) found that the complete cDNA sequence of

TRPM6 contains 8,429 nucleotides, including an open reading frame of 6,069 nucleotides. The predicted TRPM6 protein contains 2,022 amino acids, has a calculated molecular mass of roughly 234 kD, and contains a predicted ion channel domain and a protein kinase domain. Northern blot analysis detected an 8.5-kb transcript abundantly expressed in kidney and colon. By in situ hybridization to various human tissues, Schlingmann et al. (2002) observed TRPM6 mRNA in colon epithelial cells, duodenum, jejunum, and ileum. Schlingmann et al. (2002) studied 5 families (2 Turkish, 1 Swedish, 1 Israeli, and 1 Albanian) with typical HSH and discovered 7 mutations in the TRPM6 gene; the Swedish and Israeli families were nonconsanguineous and the affected children were compound heterozygotes for TRPM6 mutations. The age at onset of symptoms varied from 3 weeks to 4 months. Neurologic symptoms included tetany, muscle spasms, and seizures due to hypomagnesemic hypocalcemia. Walder et al. (2002) identified mutations in the TRPM6 gene in 7 families: 3 Bedouin Arab families from Israel, 1 Arab family from Greece, a family in Germany, and 2 additional Arab families from Israel. This was the first case of a human disorder attributed to mutation in a channel ki-

nase.

[11653] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11654] Walder, R. Y.; Landau, D.; Meyer, P.; Shalev, H.; Tsolia, M.; Borochowitz, Z.; Boettger, M. B.; Beck, G. E.; Englehardt, R. K.; Carmi, R.; Sheffield, V. C. : Mutation of TRPM6 causes familial hypomagnesemia with secondary hypocalcemia. Nature Genet. 31: 171–174, 2002. ; and

[11655] Schlingmann, K. P.; Weber, S.; Peters, M.; Nejsum, L. N.; Vitzthum, H.; Klingel, K.; Kratz, M.; Haddad, E.; Ristoff, E.; Dinour, D.; Syrrou, M.; Nielsen, S.; Sassen, M.; Waldegger, S.; S.

[11656] Further studies establishing the function and utilities of TRPM6 are found in John Hopkins OMIM database record ID 607009, and in cited publications numbered 592 and 6145 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 42 (myeloid–specific retinoic acid– responsive) (ZNF42, Accession NM_003422) is another VGAM173 host target gene. ZNF42 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF42, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF42 BINDING SITE, designated SEQ ID:9467, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11657] Another function of VGAM173 is therefore inhibition of Zinc Finger Protein 42 (myeloid-specific retinoic acid- responsive) (ZNF42, Accession NM_003422), a gene which may be one regulator of transcriptional events during hemopoietic development. Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF42. The function of ZNF42 has been established by previous studies. Zinc finger genes encode metal-binding proteins that can act as transcriptional regulators of other genes. In an effort to identify activators of the genetic cascade in hemopoietic differentiation, Hromas et al. (1991) used degenerate synthetic oligonucleotides to the conserved zinc finger histidine-cysteine link to probe a human myeloid lambda gt11 cDNA library. One of the cDNA clones obtained hybridized preferentially to mRNA from myeloid cells. Sequence analysis of the coding region for the gene

demonstrated 13 zinc finger regions and a glycine–proline–rich region between the fourth and fifth zinc finger domains. The gene was localized to 19q13.2–q13.4 by chromosomal in situ hybridization, confirmed by hybridization of a labeled probe to dot blots of flow–sorted chromosomes. Chromosome 19 contains other zinc finger genes, e.g., ZFP36 (OMIM Ref. No. 190700), which is located at 19q13.1. The new zinc finger gene, which they designated MZF–1 for 'myeloid zinc finger,' was preferentially expressed in myeloid leukemia cell lines, with the highest mRNA levels noted in cells induced to differentiate with retinoic acid. The ZNF42 gene may be a regulator of transcriptional events during hemopoietic development. The myeloid zinc finger gene 1 (MZF1) is a putative transcription factor of the C2H2 zinc finger gene family. Morris et al. (1995) found that MZF1 regulates the CD34 promoter (OMIM Ref. No. 142230) in a tissue–specific manner. They had previously demonstrated MZF–1 binding sites in the promoters of several genes expressed during myeloid differentiation.

[11658] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [11659] Hromas, R.; Collins, S. J.; Hickstein, D.; Raskind, W.; Deaven, L. L.; O'Hara, P.; Hagen, F. S.; Kaushansky, K. : A retinoic acid-responsive human zinc finger gene, MZF-1, preferentially expressed in myeloid cells. J. Biol. Chem. 266: 14183-14187, 1991. ; and
- [11660] Morris, J. F.; Rauscher, F. J., III; Davis, B.; Klemsz, M.; Xu, D.; Tenen, D.; Hromas, R. : The myeloid zinc finger gene, MZF-1, regulates the CD34 promoter in vitro. Blood 86: 3640-3647.
- [11661] Further studies establishing the function and utilities of ZNF42 are found in John Hopkins OMIM database record ID 194550, and in cited publications numbered 522-523 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 74 (Cos52) (ZNF74, Accession NM_003426) is another VGAM173 host target gene. ZNF74 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF74, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF74 BINDING SITE, designated SEQ ID:9472, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2884.

[11662] Another function of VGAM173 is therefore inhibition of Zinc Finger Protein 74 (Cos52) (ZNF74, Accession NM_003426). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF74. COAS3 (Accession NM_139020) is another VGAM173 host target gene. COAS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COAS3 BINDING SITE, designated SEQ ID:29122, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11663] Another function of VGAM173 is therefore inhibition of COAS3 (Accession NM_139020). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COAS3. FLJ10408 (Accession NM_018088) is another VGAM173 host target gene. FLJ10408 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by FLJ10408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10408 BINDING SITE, designated SEQ ID:19850, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11664] Another function of VGAM173 is therefore inhibition of FLJ10408 (Accession NM_018088). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10408. FLJ12707 (Accession NM_022067) is another VGAM173 host target gene. FLJ12707 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12707 BINDING SITE, designated SEQ ID:22609, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11665] Another function of VGAM173 is therefore inhibition of FLJ12707 (Accession NM_022067). Accordingly, utilities of

VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12707. FLJ13204 (Accession NM_024761) is another VGAM173 host target gene. FLJ13204 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13204, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13204 BINDING SITE, designated SEQ ID:24115, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11666] Another function of VGAM173 is therefore inhibition of FLJ13204 (Accession NM_024761). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13204. Interleukin 18 Binding Protein (IL18BP, Accession NM_005699) is another VGAM173 host target gene. IL18BP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL18BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of IL18BP BINDING SITE, designated SEQ ID:12251, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11667] Another function of VGAM173 is therefore inhibition of Interleukin 18 Binding Protein (IL18BP, Accession NM_005699). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL18BP. KIAA0089 (Accession XM_046056) is another VGAM173 host target gene. KIAA0089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0089 BINDING SITE, designated SEQ ID:34664, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11668] Another function of VGAM173 is therefore inhibition of KIAA0089 (Accession XM_046056). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0089. KIAA0410 (Accession NM_014778) is another VGAM173 host target gene. KIAA0410 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0410, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0410 BINDING SITE, designated SEQ ID:16618, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11669] Another function of VGAM173 is therefore inhibition of KIAA0410 (Accession NM_014778). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0410. KIAA0459 (Accession XM_027862) is another VGAM173 host target gene. KIAA0459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:30573, to the nucleotide sequence of VGAM173 RNA, herein designated

VGAM RNA, also designated SEQ ID:2884.

[11670] Another function of VGAM173 is therefore inhibition of KIAA0459 (Accession XM_027862). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459. KIAA0534 (Accession XM_049349) is another VGAM173 host target gene. KIAA0534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0534 BINDING SITE, designated SEQ ID:35383, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11671] Another function of VGAM173 is therefore inhibition of KIAA0534 (Accession XM_049349). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0534. KIAA1755 (Accession XM_028810) is another VGAM173 host target gene. KIAA1755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1755, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1755 BINDING SITE, designated SEQ ID:30749, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11672] Another function of VGAM173 is therefore inhibition of KIAA1755 (Accession XM_028810). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1755. MGC9753 (Accession NM_033419) is another VGAM173 host target gene. MGC9753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC9753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC9753 BINDING SITE, designated SEQ ID:27241, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11673] Another function of VGAM173 is therefore inhibition of MGC9753 (Accession NM_033419). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC9753. MPPE1 (Accession NM_023075) is another VGAM173 host target gene. MPPE1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MPPE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPPE1 BINDING SITE, designated SEQ ID:23332, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11674] Another function of VGAM173 is therefore inhibition of MPPE1 (Accession NM_023075). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPPE1. Phospholipid Scramblase 3 (PLSCR3, Accession NM_020360) is another VGAM173 host target gene. PLSCR3 BINDING SITE1 and PLSCR3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PLSCR3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLSCR3 BINDING

SITE1 and PLSCR3 BINDING SITE2, designated SEQ ID:21632 and SEQ ID:43637 respectively, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11675] Another function of VGAM173 is therefore inhibition of Phospholipid Scramblase 3 (PLSCR3, Accession NM_020360). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLSCR3. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942) is another VGAM173 host target gene. RPS6KA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPS6KA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA4 BINDING SITE, designated SEQ ID:10054, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11676] Another function of VGAM173 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942). Accordingly, utilities of

VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA4. SET Binding Protein 1 (SETBP1, Accession NM_015559) is another VGAM173 host target gene. SETBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SETBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SETBP1 BINDING SITE, designated SEQ ID:17825, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11677] Another function of VGAM173 is therefore inhibition of SET Binding Protein 1 (SETBP1, Accession NM_015559). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SETBP1. LOC113523 (Accession XM_054378) is another VGAM173 host target gene. LOC113523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC113523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC113523 BINDING SITE, designated SEQ ID:36157, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11678] Another function of VGAM173 is therefore inhibition of LOC113523 (Accession XM_054378). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113523. LOC124987 (Accession XM_064384) is another VGAM173 host target gene. LOC124987 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC124987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124987 BINDING SITE, designated SEQ ID:37265, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11679] Another function of VGAM173 is therefore inhibition of LOC124987 (Accession XM_064384). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124987. LOC127281 (Accession XM_059128) is an-

other VGAM173 host target gene. LOC127281 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127281 BINDING SITE, designated SEQ ID:36888, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11680] Another function of VGAM173 is therefore inhibition of LOC127281 (Accession XM_059128). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127281. LOC143425 (Accession XM_113695) is another VGAM173 host target gene. LOC143425 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143425 BINDING SITE, designated SEQ ID:42353, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11681] Another function of VGAM173 is therefore inhibition of LOC143425 (Accession XM_113695). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143425. LOC145195 (Accession XM_096731) is another VGAM173 host target gene. LOC145195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145195 BINDING SITE, designated SEQ ID:40514, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11682] Another function of VGAM173 is therefore inhibition of LOC145195 (Accession XM_096731). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145195. LOC145719 (Accession XM_096848) is another VGAM173 host target gene. LOC145719 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145719, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145719 BINDING SITE, designated SEQ ID:40574, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11683] Another function of VGAM173 is therefore inhibition of LOC145719 (Accession XM_096848). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145719. LOC145720 (Accession XM_096846) is another VGAM173 host target gene. LOC145720 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145720 BINDING SITE, designated SEQ ID:40563, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11684] Another function of VGAM173 is therefore inhibition of LOC145720 (Accession XM_096846). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145720. LOC148029 (Accession XM_086014) is another VGAM173 host target gene. LOC148029 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148029, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148029 BINDING SITE, designated SEQ ID:38444, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11685] Another function of VGAM173 is therefore inhibition of LOC148029 (Accession XM_086014). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148029. LOC150290 (Accession XM_086863) is another VGAM173 host target gene. LOC150290 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150290, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150290 BINDING SITE, designated SEQ ID:38932, to the nucleotide sequence of VGAM173 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2884.

[11686] Another function of VGAM173 is therefore inhibition of LOC150290 (Accession XM_086863). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150290. LOC152698 (Accession XM_017241) is another VGAM173 host target gene. LOC152698 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152698, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152698 BINDING SITE, designated SEQ ID:30312, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11687] Another function of VGAM173 is therefore inhibition of LOC152698 (Accession XM_017241). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152698. LOC153894 (Accession XM_087796) is another VGAM173 host target gene. LOC153894 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153894, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153894 BINDING SITE, designated SEQ ID:39427, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11688] Another function of VGAM173 is therefore inhibition of LOC153894 (Accession XM_087796). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153894. LOC157280 (Accession XM_058301) is another VGAM173 host target gene. LOC157280 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157280 BINDING SITE, designated SEQ ID:36593, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11689] Another function of VGAM173 is therefore inhibition of LOC157280 (Accession XM_058301). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC157280. LOC158062 (Accession XM_098861) is another VGAM173 host target gene. LOC158062 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158062, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158062 BINDING SITE, designated SEQ ID:41914, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11690] Another function of VGAM173 is therefore inhibition of LOC158062 (Accession XM_098861). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158062. LOC197114 (Accession XM_116987) is another VGAM173 host target gene. LOC197114 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197114 BINDING SITE, designated SEQ ID:43187, to

the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11691] Another function of VGAM173 is therefore inhibition of LOC197114 (Accession XM_116987). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197114. LOC200933 (Accession XM_117294) is another VGAM173 host target gene. LOC200933 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200933, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200933 BINDING SITE, designated SEQ ID:43365, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11692] Another function of VGAM173 is therefore inhibition of LOC200933 (Accession XM_117294). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200933. LOC255448 (Accession XM_170623) is another VGAM173 host target gene. LOC255448 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC255448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255448 BINDING SITE, designated SEQ ID:45403, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11693] Another function of VGAM173 is therefore inhibition of LOC255448 (Accession XM_170623). Accordingly, utilities of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255448. LOC91050 (Accession XM_035703) is another VGAM173 host target gene. LOC91050 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91050 BINDING SITE, designated SEQ ID:32335, to the nucleotide sequence of VGAM173 RNA, herein designated VGAM RNA, also designated SEQ ID:2884.

[11694] Another function of VGAM173 is therefore inhibition of LOC91050 (Accession XM_035703). Accordingly, utilities

of VGAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91050. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 174 (VGAM174) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11695] VGAM174 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM174 was detected is described hereinabove with reference to Figs. 1-8.

[11696] VGAM174 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM174 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11697] VGAM174 gene encodes a VGAM174 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM174 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se-

quence of VGAM174 precursor RNA is designated SEQ ID:160, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:160 is located at position 86647 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11698] VGAM174 precursor RNA folds onto itself, forming VGAM174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11699] An enzyme complex designated DICER COMPLEX, `dices` the VGAM174 folded precursor RNA into VGAM174 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM174 RNA is designated SEQ ID:2885, and is provided hereinbelow with reference to the sequence listing part.

[11700] VGAM174 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM174 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM174 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[11701] VGAM174 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM174 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM174 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM174 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM174 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[11702] The complementary binding of VGAM174 RNA, herein designated VGAM RNA, to host target binding sites on VGAM174 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM174 host target RNA into VGAM174 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11703] It is appreciated that VGAM174 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM174 host target genes. The mRNA of each one of this plurality of VGAM174 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM174 RNA, herein designated VGAM RNA, and which when bound by VGAM174 RNA causes inhibition of translation of respective one or more VGAM174 host target proteins.

[11704] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM174 gene, herein designated VGAM GENE, on one or more VGAM174 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11705] It is yet further appreciated that a function of VGAM174 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM174 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM174 correlate with, and may be deduced from, the identity of the host target genes which VGAM174 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11706] Nucleotide sequences of the VGAM174 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM174 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM174 are further described hereinbelow with reference to Table 1.

[11707] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM174 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM174 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[11708] As mentioned hereinabove with reference to Fig. 1, a function of VGAM174 gene, herein designated VGAM is inhibition of expression of VGAM174 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM174 correlate with, and may be deduced from, the identity of the target genes which VGAM174 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11709] D8S2298E (Accession NM_005671) is a VGAM174 host target gene. D8S2298E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by D8S2298E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D8S2298E BINDING SITE, designated SEQ ID:12229, to the nucleotide sequence of VGAM174 RNA, herein designated VGAM RNA, also designated SEQ ID:2885.

[11710] A function of VGAM174 is therefore inhibition of D8S2298E (Accession NM_005671). Accordingly, utilities of VGAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

D8S2298E. Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM_168542) is another VGAM174 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45224, to the nucleotide sequence of VGAM174 RNA, herein designated VGAM RNA, also designated SEQ ID:2885.

[11711] Another function of VGAM174 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF has been established by previous studies. Kilby et al. (1996) found that the protein and mRNA for both hepatocyte growth factor and its receptor (MET) are present in third trimester placentas, suggesting that HGF serves as a paracrine mediator to control placen-

tal development and growth. B cells develop in the bone marrow from progenitor cells that have been designated pre-pro-B cells, pro-B cells (no immunoglobulin, or Ig, chains chosen), pre-B cells (which have selected a heavy chain but not a light chain), and finally B cells (which express both heavy and light chains of the Ig molecule). Differentiation of pre-pro-B cells to pro-B cells requires signaling through IL7 receptor (IL7R; 146661) mediated by the pre-pro-B cell growth-stimulating factor (PPBSF), which consists of IL7 (OMIM Ref. No. 146660) and a 30-kD protein cofactor. By amino acid sequencing and RT-PCR analysis, Lai and Goldschneider (2001) determined that the PPBSF cofactor is the 30-kD beta chain of HGF (HGFB) produced independently of the 60-kD alpha chain of HGF. Formation of an IL7-HGFB heterodimer requires the presence of heparin sulfate. Functional analysis indicated that either IL7 or HGFB can maintain the viability of pre-pro-B cells, but only the heterodimer can stimulate their proliferation and differentiation into pro-B cells. Lai and Goldschneider (2001) concluded that PPBSF is a novel form of cytokine, a hybrid cytokine, consisting of the bioactive components of 2 unrelated cytokines. They proposed that through its heparin-binding and mitogenic

properties, HGFB enables IL7 to participate in cognate interactions at the stromal cell surface and transduce signals effectively at low levels of IL7R. Animal model experiments lend further support to the function of HGF.

Schmidt et al. (1995) and Uehara et al. (1995) produced targeted disruption of the HGF gene in mice and found that mice lacking the gene product fail to develop completely and die in utero. The mutation affects the embryonic liver, which is reduced in size and shows extensive loss of parenchymal cells. In addition, development of the placenta, particularly of trophoblast cells, is impaired.

HGF/SF is thought to mediate a signal exchange between the mesenchyme and epithelia during mouse development. Both the HGF gene and the gene for its receptor, the product of the MET protooncogene, are expressed in many tissues during embryonic development and in the adult. The findings of these studies indicate that HGF/SF is an essential mediator of allantoic mesenchyme-trophoblastic epithelia interaction required for placental organogenesis.

[11712] It is appreciated that the abovementioned animal model for HGF is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[11713] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11714] Lai, L.; Goldschneider, I. : Cutting edge: identification of a hybrid cytokine consisting of IL-7 and the beta-chain of the hepatocyte growth factor/scatter factor. J. Immun. 167: 3550-3554, 2001. ; and

[11715] Schmidt, C.; Bladt, F.; Goedecke, S.; Brinkmann, V.; Zschiesche, W.; Sharpe, M.; Gherardi, E.; Birchmeier, C. : Scatter factor/hepatocyte growth factor is essential for liver development.

[11716] Further studies establishing the function and utilities of HGF are found in John Hopkins OMIM database record ID 142409, and in sited publications numbered 11303-11306, 2603, 11307-1131 and 12288-11319 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1755 (Accession XM_028810) is another VGAM174 host target gene. KIAA1755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1755 BINDING SITE, designated SEQ ID:30745, to the nucleotide sequence of VGAM174 RNA, herein designated VGAM RNA, also designated SEQ ID:2885.

[11717] Another function of VGAM174 is therefore inhibition of KIAA1755 (Accession XM_028810). Accordingly, utilities of VGAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1755. LOC145474 (Accession XM_085147) is another VGAM174 host target gene. LOC145474 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145474 BINDING SITE, designated SEQ ID:37867, to the nucleotide sequence of VGAM174 RNA, herein designated VGAM RNA, also designated SEQ ID:2885.

[11718] Another function of VGAM174 is therefore inhibition of LOC145474 (Accession XM_085147). Accordingly, utilities of VGAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145474. LOC256283 (Accession XM_173105) is another VGAM174 host target gene. LOC256283 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256283 BINDING SITE, designated SEQ ID:46362, to the nucleotide sequence of VGAM174 RNA, herein designated VGAM RNA, also designated SEQ ID:2885.

[11719] Another function of VGAM174 is therefore inhibition of LOC256283 (Accession XM_173105). Accordingly, utilities of VGAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256283. LOC90593 (Accession XM_032815) is another VGAM174 host target gene. LOC90593 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90593, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90593 BINDING SITE, designated SEQ ID:31763, to the nucleotide sequence of VGAM174 RNA, herein designated

VGAM RNA, also designated SEQ ID:2885.

[11720] Another function of VGAM174 is therefore inhibition of LOC90593 (Accession XM_032815). Accordingly, utilities of VGAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90593. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 175 (VGAM175) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11721] VGAM175 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM175 was detected is described hereinabove with reference to Figs. 1–8.

[11722] VGAM175 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM175 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11723] VGAM175 gene encodes a VGAM175 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM175 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM175 precursor RNA is designated SEQ ID:161, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:161 is located at position 207866 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11724] VGAM175 precursor RNA folds onto itself, forming VGAM175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11725] An enzyme complex designated DICER COMPLEX, `dices` the VGAM175 folded precursor RNA into VGAM175 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM175 RNA is designated SEQ ID:2886, and is provided hereinbelow with reference to the sequence listing part.

[11726] VGAM175 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM175 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM175 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[11727] VGAM175 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM175 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM175 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM175 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM175 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11728] The complementary binding of VGAM175 RNA, herein designated VGAM RNA, to host target binding sites on VGAM175 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM175 host target RNA into VGAM175 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11729] It is appreciated that VGAM175 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM175 host target genes. The mRNA of each one of this plurality of VGAM175 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM175 RNA, herein designated VGAM RNA, and which when bound by VGAM175 RNA causes inhibition of translation of respective one or more VGAM175 host target proteins.

[11730] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM175 gene, herein designated VGAM GENE, on one or more VGAM175 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[11731] It is yet further appreciated that a function of VGAM175 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM175 correlate with, and may be deduced from, the identity of the host target genes which VGAM175 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11732] Nucleotide sequences of the VGAM175 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM175 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM175 are further described hereinbelow with reference to Table 1.

[11733] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM175 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM175 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11734] As mentioned hereinabove with reference to Fig. 1, a function of VGAM175 gene, herein designated VGAM is inhibition of expression of VGAM175 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM175 correlate with, and may be deduced from, the identity of the target genes which VGAM175 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11735] Amine Oxidase, Copper Containing 3 (vascular adhesion protein 1) (AOC3, Accession NM_003734) is a VGAM175 host target gene. AOC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AOC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AOC3 BINDING SITE, designated SEQ ID:9823, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11736] A function of VGAM175 is therefore inhibition of Amine Oxidase, Copper Containing 3 (vascular adhesion protein 1) (AOC3, Accession NM_003734), a gene which catalyze the oxidative conversion of amines to aldehydes in the presence of copper and quinone cofactor. Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AOC3. The function of AOC3 has been established by previous studies. Zhang and McIntire (1996) cloned a novel amine oxidase, HPAO, from a human placenta cDNA library. The gene encodes a 763–amino acid polypeptide which contains a secretory signal sequence. Morris et al. (1997) cloned a partial rat cDNA which they identified as the rat homolog of HPAO. They reported that the product is a major protein on the adipocyte plasma membrane. Smith et al. (1998) studied vascular adhesion protein–1 (VAP1), a molecule expressed in endothelial cells that mediates binding of lymphocytes. These authors noted that the amino acid sequence of VAP1 was identical to that of HPAO. Expression studies revealed that the VAP1 protein has adhesive properties and also has functional monoamine oxidase activity. Northern blot analysis detected a 4.1–kb mRNA in a wide variety of human tissues.

- [11737] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [11738] Morris, N. J.; Ducret, A.; Aebersold, R.; Ross, S. A.; Keller, S. R.; Lienhard, G. E. : Membrane amine oxidase cloning and identification as a major protein in the adipocyte plasma membrane. *J. Biol. Chem.* 272: 9388–9392, 1997. ; and
- [11739] Smith, D. J.; Salmi, M.; Bono, P.; Hellman, J.; Leu, T.; Jalkanen, S. : Cloning of vascular adhesion protein 1 reveals a novel multifunctional adhesion molecule. *J. Exp. Med.* 188: 17–27.
- [11740] Further studies establishing the function and utilities of AOC3 are found in John Hopkins OMIM database record ID 603735, and in cited publications numbered 6313–631 and 5187–5188 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Bardet–Biedl Syndrome 4 (BBS4, Accession NM_033028) is another VGAM175 host target gene. BBS4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BBS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus–

trates the complementarity of the nucleotide sequences of BBS4 BINDING SITE, designated SEQ ID:26921, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11741] Another function of VGAM175 is therefore inhibition of Bardet-Biedl Syndrome 4 (BBS4, Accession NM_033028). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BBS4. Chromosome X Open Reading Frame 6 (CXorf6, Accession NM_005491) is another VGAM175 host target gene. CXorf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXorf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf6 BINDING SITE, designated SEQ ID:11994, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11742] Another function of VGAM175 is therefore inhibition of Chromosome X Open Reading Frame 6 (CXorf6, Accession NM_005491). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with CXorf6. Dystrophia Myotonica-protein Kinase (DMPK, Accession NM_004409) is another VGAM175 host target gene. DMPK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DMPK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMPK BINDING SITE, designated SEQ ID:10663, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11743] Another function of VGAM175 is therefore inhibition of Dystrophia Myotonica-protein Kinase (DMPK, Accession NM_004409). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMPK. Milk Fat Globule-EGF Factor 8 Protein (MFGE8, Accession NM_005928) is another VGAM175 host target gene. MFGE8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MFGE8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MFGE8 BIND-

ING SITE, designated SEQ ID:12558, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11744] Another function of VGAM175 is therefore inhibition of Milk Fat Globule-EGF Factor 8 Protein (MFGE8, Accession NM_005928), a gene which links apoptotic cells to phagocytes. Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MFGE8. The function of MFGE8 has been established by previous studies. Stubbs et al. (1990) identified a cDNA for a mouse mammary epithelial cell surface protein, which they called milk fat globule-EGF factor 8 (MFGE8) because of its regions of sequence similarity to epidermal growth factor (EGF) and blood clotting factors VIII (OMIM Ref. No. 306700) and V (OMIM Ref. No. 227400). Larocca et al. (1991) raised monoclonal antibodies to a 46-kD human milk fat globule protein, later to be identified as the human homolog of MFGE8, and isolated a partial cDNA by immunoscreening a lambda gt11 human breast cDNA library. Collins et al. (1997) cloned the MFGE8 gene from a human infant cDNA brain library. The gene predicts a protein of 387 amino acids of which 263 (68%) are identical or conserved matches with the mouse

protein. Hanayama et al. (2002) found that MFGE8 is a factor that links apoptotic cells to phagocytes. MFGE8 specifically bound to apoptotic cells by recognizing aminophospholipids such as phosphatidylserine. MFGE8, when engaged by phospholipids, bound to cells via its RGD (arg-gly-asp) motif. It bound particularly strongly to cells expressing alpha-V-beta-3 integrin (see OMIM Ref. No. 193210). The NIH3T3 cell transformants that expressed a high level of alpha-V-beta-3 integrin engulfed apoptotic cells when MFGE8 was added. MFGE8 carrying a point mutation in the RGD motif behaved as a dominant-negative form, and inhibited the phagocytosis of apoptotic cells by peritoneal macrophages in vitro and in vivo. Hanayama et al. (2002) concluded that MFGE8 secreted from activated macrophages binds to apoptotic cells and brings them to phagocytes for engulfment.

[11745] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11746] Stubbs, J. D.; Lekutis, C.; Singer, K. L.; Bui, A.; Yuzuki, D.; Srinivasan, U.; Parry, G. : cDNA cloning of a mouse mammary epithelial cell surface protein reveals the existence of epidermal growth factor-like domains linked to factor

VIII-like sequences. Proc. Nat. Acad. Sci. 87: 8417–8421, 1990. ; and

[11747] Hanayama, R.; Tanaka, M.; Miwa, K.; Shinohara, A.; Iwamatsu, A.; Nagata, S. : Identification of a factor that links apoptotic cells to phagocytes. Nature 417: 182–187, 2002.

[11748] Further studies establishing the function and utilities of MFGE8 are found in John Hopkins OMIM database record ID 602281, and in cited publications numbered 8571–8576 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 7 (MLLT7, Accession NM_005938) is another VGAM175 host target gene. MLLT7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLLT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT7 BINDING SITE, designated SEQ ID:12575, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11749] Another function of VGAM175 is therefore inhibition of Myeloid/lymphoid Or Mixed–lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 7 (MLLT7, Accession NM_005938), a gene which is a Member of the fork–head family. Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT7. The function of MLLT7 has been established by previous studies. A breakpoint in 11q23 is frequently involved in translocations underlying hematologic malignancies, especially acute leukemias. The human homolog of Drosophila 'trithorax,' symbolized MLL (OMIM Ref. No. 159555), for 'myeloid–lymphoid leukemia' or 'mixed lineage leukemia,' is located at this breakpoint. Part of the MLL gene is fused with other genes in leukemia: AF4 (OMIM Ref. No. 159557) in t(4;11)(q21;q23); ENL (OMIM Ref. No. 159556) in t(11;19)(q23;p13.3), AF9 (OMIM Ref. No. 159558) in t(9;11)(p22;q23), AF6 (OMIM Ref. No. 159559) in t(6;11)(q27;q23), and AFX in t(X;11)(q13;q23). Translocations at 11q23 result in the formation of 2 derivative chromosomes that encode chimeric transcripts. The der(11) transcript contains 5–prime MLL sequences fused to 3–prime sequences of the gene located on the partner

chromosome, whereas the other derivative chromosome contains the 5-prime sequence of the partner gene potentially fused to the 3-prime sequence of MLL. However, in 25% of patients, translocations are associated with deletions of MLL sequence that is 3-prime to the breakpoint. Thus, in these cases, a fusion transcript from the other derivative chromosome cannot be formed. In addition, analysis of complex 11q23 translocations revealed that the der(11) junction is always conserved. These data indicate that the fusion transcript encoded by the der(11) must be critical to leukemogenesis. Corral et al. (1993) found from a partial sequence of a fusion between MLL and the AFX1 gene from the X chromosome that the latter is rich in ser/pro codons, like the ENL mRNA. Corral et al. (1993) concluded that heterogeneous 11q23 abnormalities may cause attachment of ser/pro-rich segments to the N terminus of MLL, lacking the zinc finger region, and that translocations occur in early hematopoietic cells, before commitment to distinct lineages. Parry et al. (1994) cloned and sequenced the t(X;11) breakpoint region from a cell line established from an infant with acute lymphocytic leukemia. The AFX1 gene (also symbolized MLLT7) was expressed in a variety of cell types. Sequence analysis

indicated a high degree of homology between AFX1 and the forkhead family of transcription factors. The high degree of identity within the forkhead region and the lack of homology outside that region suggested to the authors that AFX1 represents a novel forkhead family member. It was predicted that a chimeric fusion protein that altered DNA binding activity would result from the translocation.

[11750] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11751] Corral, J.; Forster, A.; Thompson, S.; Lampert, F.; Kaneko, Y.; Slater, R.; Kroes, W. G.; van der Schoot, C. E.; Ludwig, W.-D.; Karpas, A.; Pocock, C.; Cotter, F.; Rabbitts, T. H. : Acute leukemias of different lineages have similar MLL gene fusions encoding related chimeric proteins resulting from chromosomal translocation. *Proc. Nat. Acad. Sci.* 90: 8538–8542, 1993. ; and

[11753] Further studies establishing the function and utilities of MLLT7 are found in John Hopkins OMIM database record

ID 300033, and in cited publications numbered 916 and 12194–8709 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Kinase, CAMP-dependent, Catalytic, Alpha (PRKACA, Accession NM_002730) is another VGAM175 host target gene. PRKACA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKACA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKACA BINDING SITE, designated SEQ ID:8598, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11754] Another function of VGAM175 is therefore inhibition of Protein Kinase, CAMP-dependent, Catalytic, Alpha (PRKACA, Accession NM_002730), a gene which phosphorylates target proteins on serine or threonine residues. Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKACA. The function of PRKACA has been established by previous studies. Most of the effects of cAMP in the eukaryotic cell are mediated through the

phosphorylation of target proteins on serine or threonine residues by the cAMP-dependent protein kinase (EC 2.7.1.37). The inactive cAMP-dependent protein kinase is a tetramer composed of 2 regulatory and 2 catalytic subunits. The cooperative binding of 4 molecules of cAMP dissociates the enzyme in a regulatory subunit dimer and 2 free active catalytic subunits. In the human, 4 different regulatory subunits (PRKAR1A, 188830; PRKAR1B, 176911; PRKAR2A, 176910; and PRKAR2B, 176912) and 3 catalytic subunits (PRKACA; PRKACB, 176892; and PRKACG 176893) have been identified. Using PCR and Southern blot analysis, Tasken et al. (1996) assigned the PRKACA gene to chromosome 19. By 2-color fluorescence in situ hybridization, they regionalized the assignment to 19p13.1. Animal model experiments lend further support to the function of PRKACA. The intracellular second messenger cAMP affects cell physiology by directly interacting with effector molecules that include cyclic nucleotide-gated ion channels, cAMP-regulated G protein exchange factors, and cAMP-dependent protein kinases (PKA). Two catalytic subunits, C-alpha (OMIM Ref. No. PRKACA) and C-beta (OMIM Ref. No. PRKACB), are expressed in the mouse and mediate the effects of PKA. Skalhegg et al.

(2002) generated a null mutation in the major catalytic subunit of PKA, C-alpha, and observed early postnatal lethality in the majority of C-alpha knockout mice. Surprisingly, a small percentage of C-alpha knockout mice, although runted, survived to adulthood. This growth retardation was not due to decreased GH (OMIM Ref. No. 139250) production but did correlate with a reduction in IGF1 (OMIM Ref. No. 147440) mRNA in the liver and diminished production of the major urinary proteins in kidney. In these animals, compensatory increases in C-beta levels occurred in brain whereas many tissues, including skeletal muscle, heart, and sperm, contained less than 10% of the normal PKA activity. Analysis of sperm in C-alpha knockout males revealed that spermatogenesis progressed normally but that mature sperm had defective forward motility

[11755] It is appreciated that the abovementioned animal model for PRKACA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[11756] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [11757] Skalhegg, B. S.; Huang, Y.; Su, T.; Idzerda, R. L.; McKnight, G. S.; Burton, K. A. : Mutation of the C-alpha subunit of PKA leads to growth retardation and sperm dysfunction. *Molec. Endocr.* 16: 630-639, 2002. ; and
- [11758] Tasken, K.; Solberg, R.; Zhao, Y.; Hansson, V.; Jahnsen, T.; Siciliano, M. J. : The gene encoding the catalytic subunit C-alpha of cAMP-dependent protein kinase (locus PRKACA) localize.
- [11759] Further studies establishing the function and utilities of PRKACA are found in John Hopkins OMIM database record ID 601639, and in cited publications numbered 6683-6684 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TEM6 (Accession NM_022748) is another VGAM175 host target gene. TEM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM6 BINDING SITE, designated SEQ ID:22961, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.
- [11760] Another function of VGAM175 is therefore inhibition of

TEM6 (Accession NM_022748), a gene which displays elevated expression during tumor angiogenesis. Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM6. The function of TEM6 has been established by previous studies. Using serial analysis of gene expression (SAGE), St Croix et al. (2000) identified partial cDNAs corresponding to several tumor endothelial markers (TEMs) that displayed elevated expression during tumor angiogenesis. Among the genes they identified was TEM6. Using database searches and 5-prime RACE, Carson-Walter et al. (2001) derived sequences covering the entire TEM6 coding region, which encodes a 261-amino acid protein.

[11761] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11762] Carson-Walter, E. B.; Watkins, D. N.; Nanda, A.; Vogelstein, B.; Kinzler, K. W.; St. Croix, B. : Cell surface tumor endothelial markers are conserved in mice and humans. Cancer Res. 61: 6649-6655, 2001. ; and

[11763] St. Croix, B.; Rago, C.; Velculescu, V.; Traverso, G.; Romans, K. E.; Montgomery, E.; Lal, A.; Riggins, G. J.;

Lengauer, C.; Vogelstein, B.; Kinzler, K. W. : Genes expressed in human t.

[11764] Further studies establishing the function and utilities of TEM6 are found in John Hopkins OMIM database record ID 606825, and in cited publications numbered 689 and 6907 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transcription Factor AP-4 (activating enhancer binding protein 4) (TFAP4, Accession NM_003223) is another VGAM175 host target gene. TFAP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFAP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFAP4 BINDING SITE, designated SEQ ID:9224, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11765] Another function of VGAM175 is therefore inhibition of Transcription Factor AP-4 (activating enhancer binding protein 4) (TFAP4, Accession NM_003223), a gene which activates both viral and cellular genes by binding to the symmetrical dna sequence 5'-cagctg-3'. Accordingly, util-

ities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFAP4. The function of TFAP4 has been established by previous studies. Transcription factors of the basic helix-loop-helix-zipper (bHLH-Zip) family contain a basic domain, which is used for DNA binding, and HLH and Zip domains, which are used for oligomerization. Transcription factor AP4 activates both viral and cellular genes by binding to the symmetrical DNA sequence CAGCTG (Mermod et al., 1988; Hu et al., 1990). By interspecific backcross analysis, Steingrimsson et al. (1995) mapped the Tfap4 gene to mouse chromosome 16, close to the gene for sperm protamine P1 (PRM1; 182880). Since the PRM1 is located on chromosome 16p13.3 in the human, they suggested that TFAP4 is probably on human chromosome 16. The International Radiation Hybrid Mapping Consortium mapped the TFAP4 gene to chromosome 16p13 (sts-S73885).

[11766] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11767] Hu, Y.-F.; Luscher, B.; Admon, A.; Mermod, N.; Tjian, R. : Transcription factor AP-4 contains multiple dimerization

domains that regulate dimer specificity. Genes Dev. 4: 1741–1752, 1990. ; and

[11768] Steingrimsson, E.; Sawadogo, M.; Gilbert, D. J.; Zervos, A. S.; Brent, R.; Blonar, M. A.; Fisher, D. E.; Copeland, N. G.; Jenkins, N. A. : Murine chromosomal location of five bHLH–Zip tr.

[11769] Further studies establishing the function and utilities of TFAP4 are found in John Hopkins OMIM database record ID 600743, and in cited publications numbered 7581–758 and 12617 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Necrosis Factor (TNF superfamily, member 2) (TNF, Accession XM_165823) is another VGAM175 host target gene. TNF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNF BINDING SITE, designated SEQ ID:43771, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11770] Another function of VGAM175 is therefore inhibition of Tumor Necrosis Factor (TNF superfamily, member 2) (TNF,

Accession XM_165823), a gene which mediates proinflammatory responses and apoptosis. Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNF. The function of TNF has been established by previous studies. Ruuls and Sedgwick (1999) reviewed the problem of unlinking TNF biology from that of the MHC. Dysregulation and, in particular, overproduction of TNF have been implicated in a variety of human diseases, including sepsis, cerebral malaria, and autoimmune diseases such as multiple sclerosis (OMIM Ref. No. 126200), rheumatoid arthritis, systemic lupus erythematosus (OMIM Ref. No. 152700), and Crohn disease (see OMIM Ref. No. 266600), as well as cancer. Susceptibility to many of these diseases is thought to have a genetic basis, and the TNF gene is considered a candidate predisposing gene. However, unraveling the importance of genetic variation in the TNF gene to disease susceptibility or severity is complicated by its location within the MHC, a highly polymorphic region that encodes numerous genes involved in immunologic responses. Ruuls and Sedgwick (1999) reviewed studies that had analyzed the contribution of TNF and related genes to susceptibility to human disease, and they dis-

cussed how the presence of the TNF gene within the MHC may potentially complicate the interpretation of studies in animal models in which the TNF gene is experimentally manipulated. Animal model experiments lend further support to the function of TNF. Bruce et al. (1996) used targeted gene disruption to generate mice lacking either the p55 or the p75 TNF receptors; mice lacking both p55 and p75 were generated from crosses of the singly deficient mice. The TNFR-deficient (TNFR-KO) mice exhibited no overt phenotype under unchallenged conditions. Bruce et al. (1996) reported that damage to neurons caused by focal cerebral ischemia and epileptic seizures was exacerbated in the TNFR-KO mice, indicating that TNF serves a neuroprotective function. Their studies indicated that TNF protects neurons by stimulating antioxidative pathways. Injury-induced microglial activation was suppressed in TNFR-KO mice. They concluded that drugs which target TNF signaling pathways may prove beneficial in treating stroke or traumatic brain injury.

[11771] It is appreciated that the abovementioned animal model for TNF is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[11772] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11773] Ruuls, S. R.; Sedgwick, J. D. : Unlinking tumor necrosis factor biology from the major histocompatibility complex: lessons from human genetics and animal models. Am. J. Hum. Genet. 65: 294–301, 1999. ; and

[11775] Further studies establishing the function and utilities of TNF are found in John Hopkins OMIM database record ID 191160, and in cited publications numbered 663, 9569–9574, 451, 9575, 12122–9577, 3684, 12303–9579, 3051, 9580–9582, 2981, 9583–9584, 9798, 10523–10539, 10542, 12143–10541, 10543–10544, 12305–1054 and 10567 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 20 Open Reading Frame 130 (C20orf130, Accession XM_029741) is another VGAM175 host target gene. C20orf130 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by C20orf130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf130 BINDING SITE, designated SEQ ID:30936, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11776] Another function of VGAM175 is therefore inhibition of Chromosome 20 Open Reading Frame 130 (C20orf130, Accession XM_029741). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf130. DKFZP434K1772 (Accession XM_041936) is another VGAM175 host target gene. DKFZP434K1772 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434K1772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434K1772 BINDING SITE, designated SEQ ID:33630, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11777] Another function of VGAM175 is therefore inhibition of DKFZP434K1772 (Accession XM_041936). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434K1772. DKFZP564F0522 (Accession XM_043885) is another VGAM175 host target gene. DKFZP564F0522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564F0522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564F0522 BINDING SITE, designated SEQ ID:34041, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11778] Another function of VGAM175 is therefore inhibition of DKFZP564F0522 (Accession XM_043885). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564F0522. FLJ10661 (Accession NM_018172) is another VGAM175 host target gene. FLJ10661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10661, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10661 BINDING SITE, designated SEQ ID:19995, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11779] Another function of VGAM175 is therefore inhibition of FLJ10661 (Accession NM_018172). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10661. FLJ14950 (Accession NM_032865) is another VGAM175 host target gene. FLJ14950 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14950 BINDING SITE, designated SEQ ID:26676, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11780] Another function of VGAM175 is therefore inhibition of FLJ14950 (Accession NM_032865). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ14950. FLJ20847 (Accession XM_170677) is another VGAM175 host target gene. FLJ20847 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20847, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20847 BINDING SITE, designated SEQ ID:45458, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11781] Another function of VGAM175 is therefore inhibition of FLJ20847 (Accession XM_170677). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20847. KIAA1100 (Accession NM_014901) is another VGAM175 host target gene. KIAA1100 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1100 BINDING SITE, designated SEQ ID:17084, to the nucleotide sequence of

VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11782] Another function of VGAM175 is therefore inhibition of KIAA1100 (Accession NM_014901). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1100. Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM_017971) is another VGAM175 host target gene. MRPL20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL20 BINDING SITE, designated SEQ ID:19696, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11783] Another function of VGAM175 is therefore inhibition of Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM_017971). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL20. PP1628 (Accession NM_025201) is another VGAM175 host target gene.

PP1628 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PP1628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1628 BINDING SITE, designated SEQ ID:24856, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11784] Another function of VGAM175 is therefore inhibition of PP1628 (Accession NM_025201). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1628. PRKRI (Accession NM_006260) is another VGAM175 host target gene. PRKRI BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRKRI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKRI BINDING SITE, designated SEQ ID:12943, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11785] Another function of VGAM175 is therefore inhibition of PRKRI (Accession NM_006260). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKRI. Sema Domain, Transmembrane Domain (TM), and Cytoplasmic Domain, (semaphorin) 6A (SEMA6A, Accession NM_020796) is another VGAM175 host target gene. SEMA6A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA6A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA6A BINDING SITE, designated SEQ ID:21880, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11786] Another function of VGAM175 is therefore inhibition of Sema Domain, Transmembrane Domain (TM), and Cytoplasmic Domain, (semaphorin) 6A (SEMA6A, Accession NM_020796). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA6A. Sp2 Transcription Factor (SP2, Accession NM_003110) is another VGAM175

host target gene. SP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP2 BINDING SITE, designated SEQ ID:9080, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11787] Another function of VGAM175 is therefore inhibition of Sp2 Transcription Factor (SP2, Accession NM_003110). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP2. TGFB1-induced Anti-apoptotic Factor 1 (TIAF1, Accession NM_078471) is another VGAM175 host target gene. TIAF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIAF1 BINDING SITE, designated SEQ ID:27797, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:2886.

[11788] Another function of VGAM175 is therefore inhibition of TGF β 1-induced Anti-apoptotic Factor 1 (TIAF1, Accession NM_078471). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIAF1. LOC124930 (Accession XM_058867) is another VGAM175 host target gene. LOC124930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124930 BINDING SITE, designated SEQ ID:36766, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11789] Another function of VGAM175 is therefore inhibition of LOC124930 (Accession XM_058867). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124930. LOC145719 (Accession XM_096848) is another VGAM175 host target gene. LOC145719 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC145719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145719 BINDING SITE, designated SEQ ID:40573, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11790] Another function of VGAM175 is therefore inhibition of LOC145719 (Accession XM_096848). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145719. LOC145720 (Accession XM_096846) is another VGAM175 host target gene. LOC145720 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145720 BINDING SITE, designated SEQ ID:40564, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11791] Another function of VGAM175 is therefore inhibition of LOC145720 (Accession XM_096846). Accordingly, utilities

of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145720. LOC145725 (Accession XM_085211) is another VGAM175 host target gene. LOC145725 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145725 BINDING SITE, designated SEQ ID:37947, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11792] Another function of VGAM175 is therefore inhibition of LOC145725 (Accession XM_085211). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145725. LOC145732 (Accession XM_085218) is another VGAM175 host target gene. LOC145732 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145732, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145732 BINDING SITE, designated SEQ ID:37956, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11793] Another function of VGAM175 is therefore inhibition of LOC145732 (Accession XM_085218). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145732. LOC146562 (Accession NM_139170) is another VGAM175 host target gene. LOC146562 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146562 BINDING SITE, designated SEQ ID:29178, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11794] Another function of VGAM175 is therefore inhibition of LOC146562 (Accession NM_139170). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146562. LOC151878 (Accession XM_087329) is another VGAM175 host target gene. LOC151878 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151878, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151878 BINDING SITE, designated SEQ ID:39172, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11795] Another function of VGAM175 is therefore inhibition of LOC151878 (Accession XM_087329). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151878. LOC197419 (Accession XM_117035) is another VGAM175 host target gene. LOC197419 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC197419, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197419 BINDING SITE, designated SEQ ID:43209, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11796] Another function of VGAM175 is therefore inhibition of

LOC197419 (Accession XM_117035). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197419. LOC257551 (Accession XM_175158) is another VGAM175 host target gene. LOC257551 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257551, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257551 BINDING SITE, designated SEQ ID:46645, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11797] Another function of VGAM175 is therefore inhibition of LOC257551 (Accession XM_175158). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257551. LOC257601 (Accession XM_175231) is another VGAM175 host target gene. LOC257601 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257601, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC257601 BINDING SITE, designated SEQ ID:46696, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11798] Another function of VGAM175 is therefore inhibition of LOC257601 (Accession XM_175231). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257601. LOC91300 (Accession XM_170568) is another VGAM175 host target gene. LOC91300 BINDING SITE1 and LOC91300 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC91300, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91300 BINDING SITE1 and LOC91300 BINDING SITE2, designated SEQ ID:45386 and SEQ ID:29005 respectively, to the nucleotide sequence of VGAM175 RNA, herein designated VGAM RNA, also designated SEQ ID:2886.

[11799] Another function of VGAM175 is therefore inhibition of LOC91300 (Accession XM_170568). Accordingly, utilities of VGAM175 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC91300. MAD2 Mitotic Arrest Deficient-like 1 (yeast) (MAD2L1, Accession NM_002358) is another VGAM176 host target gene. MAD2L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAD2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAD2L1 BINDING SITE, designated SEQ ID:8170, to the nucleotide sequence of VGAM176 RNA, herein designated VGAM RNA, also designated SEQ ID:2887.

[11800] Another function of VGAM176 is therefore inhibition of MAD2 Mitotic Arrest Deficient-like 1 (yeast) (MAD2L1, Accession NM_002358), a gene which may monitor the completeness of the spindle-kinetochore attachment. delays the onset of anaphase when this process is not complete. Accordingly, utilities of VGAM176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAD2L1. The function of MAD2L1 has been established by previous studies. Using a yeast 2-hybrid analysis with the cytoplasmic tails of several a disintegrin and metalloproteinase domain (ADAM) pro-

teins as bait, Nelson et al. (1999) found that MAD2L1 interacts strongly with TACE (ADAM17; 603639) but not with ADAM9 (OMIM Ref. No. 602713), which interacts with MAD2L2, or with other ADAMs tested. Further binding analyses defined a 35-amino acid stretch of TACE containing a proline-rich SH3-ligand domain (OMIM Ref. No. PXPXXP) as the interaction site for MAD2L1. Luo et al. (2002) showed that RNA interference-mediated suppression of MAD1 (OMIM Ref. No. 602686) function in mammalian cells caused loss of MAD2 kinetochore localization and impairment of the spindle checkpoint. MAD1 and CDC20 (OMIM Ref. No. 603618) contain MAD2-binding motifs that share a common consensus, and the authors identified a class of MAD2-binding peptides (MBPs) with a similar consensus. Binding of one of these ligands, MBP1, triggered an extensive rearrangement of the tertiary structure of MAD2. MAD2 also underwent a similar striking structural change upon binding to a MAD1 or CDC20 binding motif peptide. These data suggested that, upon checkpoint activation, MAD1 recruits MAD2 to unattached kinetochores and may promote binding of MAD2 to CDC20. Animal model experiments lend further support to the function of MAD2L1. The initiation of chromosome

segregation at anaphase is linked by the spindle assembly checkpoint to the completion of chromosome-microtubule attachment during metaphase. To determine the function of the Mad2 protein during normal cell division, Dobles et al. (2000) knocked out the Mad2 gene in mice. They found that embryonic cells lacking Mad2 at embryonic day 5.5, like *mad2* yeast, grew normally but were unable to arrest in response to spindle disruption. At embryonic day 6.5, the cells of the epiblast began rapid cell division, and the absence of a checkpoint resulted in widespread chromosome missegregation and apoptosis. In contrast, the postmitotic trophoblast giant cells survived without Mad2. Thus, the spindle assembly checkpoint is required for accurate chromosome segregation in mitotic mouse cells and for embryonic viability, even in the absence of spindle damage. Shonn et al. (2000) characterized the spindle checkpoint in meiosis of *S. cerevisiae* by comparing wildtype and *mad2*-deficient yeast. In the absence of the checkpoint, the frequency of meiosis I missegregation increased with increasing chromosome length, reaching 19% for the longest chromosome. Meiosis I nondisjunction in spindle checkpoint mutants could be prevented by delaying the onset of anaphase. In a recom-

binant-defective mutant, the checkpoint delayed the biochemical events of anaphase I, suggesting that chromosomes that are attached to microtubules but are not under tension can activate the spindle checkpoint. Spindle checkpoint mutants reduced the accuracy of chromosome segregation in meiosis I much more than that in meiosis II, suggesting that checkpoint defects may contribute to Down syndrome (OMIM Ref. No. 190685). Shonn et al. (2000) showed that the budding yeast spindle checkpoint, which is largely dispensable in wildtype mitosis, plays a critical role in meiotic chromosome segregation. They suggested that the difference may reflect the different chromosome linkages in mitosis and meiosis I. In mitosis, sister chromatid cohesion forces sister kinetochores to face opposite spindle poles. In meiosis I, homologs are linked at sites of recombination that can be far from the kinetochores, creating a floppy linkage. If the nearest recombination event is further from the centromere on long chromosomes, this idea may explain why long chromosomes preferentially nondisjoin in checkpoint-defective cells. Michel et al. (2001) reported that deletion of one MAD2 allele results in a defective mitotic checkpoint in both human cancer cells and murine primary embryonic

fibroblasts. Checkpoint-defective cells show premature sister chromatid separation in the presence of spindle inhibitors and an elevated rate of chromosome missegregation events in the absence of these agents. Furthermore, Mad2 +/– mice develop lung tumors at high rates after long latencies, implicating defects in the mitotic checkpoint in tumorigenesis

[11801] It is appreciated that the abovementioned animal model for MAD2L1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[11802] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11803] Michel, L. S.; Liberal, V.; Chatterjee, A.; Kirchwegger, R.; Pasche, B.; Gerald, W.; Dobles, M.; Sorger, P. K.; Murty, V. V. S.; Benezra, R. : MAD2 haplo-insufficiency causes premature anaphase and chromosome instability in mammalian cells. Nature 409: 355–359, 2001. ; and

[11804] Luo, X.; Tang, Z.; Rizo, J.; Yu, H. : The Mad2 spindle checkpoint protein undergoes similar major conformational changes upon binding to either Mad1 or Cdc20. Molec. Cell 9: 59–71, 2002.

[11805] Further studies establishing the function and utilities of MAD2L1 are found in John Hopkins OMIM database record ID 601467, and in cited publications numbered 2758–2768 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Macrophage Scavenger Receptor 1 (MSR1, Accession NM_138715) is another VGAM176 host target gene. MSR1 BINDING SITE1 and MSR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MSR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSR1 BINDING SITE1 and MSR1 BINDING SITE2, designated SEQ ID:28960 and SEQ ID:28962 respectively, to the nucleotide sequence of VGAM176 RNA, herein designated VGAM RNA, also designated SEQ ID:2887.

[11806] Another function of VGAM176 is therefore inhibition of Macrophage Scavenger Receptor 1 (MSR1, Accession NM_138715), a gene which plays a role in endocytosis of macromolecules. Accordingly, utilities of VGAM176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSR1. The function of

MSR1 has been established by previous studies. Deletions on 8p23–p22 in prostate cancer cells (Latil and Lidereau, 1998) and linkage studies in families affected with hereditary prostate cancer (Xu et al., 2001) have implicated this region in the development of prostate cancer. The MSR1 gene is located at 8p22 and functions in several processes proposed to be relevant to prostate carcinogenesis. In studies of families affected with hereditary prostate cancer, Xu et al. (2002) identified 6 missense mutations and 1 nonsense mutation in the MSR1 gene. A family-based linkage and association test indicated that these mutations cosegregate with prostate cancer ($P = 0.0007$). In addition, among men of European descent, MSR1 mutations were detected in 4.4% of individuals affected with nonhereditary prostate cancer as compared with 0.8% of unaffected men ($P = 0.009$). Among African American men, these values were 12.5% and 1.8%, respectively ($P = 0.01$). These results showed that MSR1 may be important in susceptibility to prostate cancer in men of both African American and European descent.

[11807] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [11808] Emi, M.; Asaoka, H.; Matsumoto, A.; Itakura, H.; Kurihara, Y.; Wada, Y.; Kanamori, H.; Yazaki, Y.; Takahashi, E.; Lepert, M.; Lalouel, J.-M.; Kodama, T.; Mukai, T. : Structure, organization, and chromosomal mapping of the human macrophage scavenger receptor gene. *J. Biol. Chem.* 268: 2120–2125, 1993. ; and
- [11809] Latil, A.; Lidereau, R. : Genetic aspects of prostate cancer. *Virchows Arch.* 432: 389–406, 1998.
- [11810] Further studies establishing the function and utilities of MSR1 are found in John Hopkins OMIM database record ID 153622, and in cited publications numbered 11661–11665 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tripartite Motif-containing 39 (TRIM39, Accession NM_021253) is another VGAM176 host target gene. TRIM39 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRIM39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM39 BINDING SITE, designated SEQ ID:22225, to the nucleotide sequence of VGAM176 RNA, herein designated VGAM RNA, also designated SEQ

ID:2887.

[11811] Another function of VGAM176 is therefore inhibition of Tripartite Motif-containing 39 (TRIM39, Accession NM_021253). Accordingly, utilities of VGAM176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM39. COP9 Constitutive Photomorphogenic Homolog Subunit 7B (Arabidopsis) (COPS7B, Accession NM_022730) is another VGAM176 host target gene. COPS7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COPS7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COPS7B BINDING SITE, designated SEQ ID:22930, to the nucleotide sequence of VGAM176 RNA, herein designated VGAM RNA, also designated SEQ ID:2887.

[11812] Another function of VGAM176 is therefore inhibition of COP9 Constitutive Photomorphogenic Homolog Subunit 7B (Arabidopsis) (COPS7B, Accession NM_022730). Accordingly, utilities of VGAM176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COPS7B. KIAA1229 (Accession XM_030665)

is another VGAM176 host target gene. KIAA1229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1229 BINDING SITE, designated SEQ ID:31095, to the nucleotide sequence of VGAM176 RNA, herein designated VGAM RNA, also designated SEQ ID:2887.

[11813] Another function of VGAM176 is therefore inhibition of KIAA1229 (Accession XM_030665). Accordingly, utilities of VGAM176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1229. NRF (Accession NM_017544) is another VGAM176 host target gene. NRF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRF BINDING SITE, designated SEQ ID:18983, to the nucleotide sequence of VGAM176 RNA, herein designated VGAM RNA, also designated SEQ ID:2887.

[11814] Another function of VGAM176 is therefore inhibition of NRF (Accession NM_017544). Accordingly, utilities of VGAM176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRF. UBX Domain Containing 2 (UBXD2, Accession XM_043196) is another VGAM176 host target gene. UBXD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UBXD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBXD2 BINDING SITE, designated SEQ ID:33914, to the nucleotide sequence of VGAM176 RNA, herein designated VGAM RNA, also designated SEQ ID:2887.

[11815] Another function of VGAM176 is therefore inhibition of UBX Domain Containing 2 (UBXD2, Accession XM_043196). Accordingly, utilities of VGAM176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBXD2. LOC115219 (Accession XM_055499) is another VGAM176 host target gene. LOC115219 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC115219, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115219 BINDING SITE, designated SEQ ID:36279, to the nucleotide sequence of VGAM176 RNA, herein designated VGAM RNA, also designated SEQ ID:2887.

[11816] Another function of VGAM176 is therefore inhibition of LOC115219 (Accession XM_055499). Accordingly, utilities of VGAM176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115219. LOC158187 (Accession XM_098892) is another VGAM176 host target gene. LOC158187 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158187 BINDING SITE, designated SEQ ID:41921, to the nucleotide sequence of VGAM176 RNA, herein designated VGAM RNA, also designated SEQ ID:2887.

[11817] Another function of VGAM176 is therefore inhibition of LOC158187 (Accession XM_098892). Accordingly, utilities of VGAM176 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC158187. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 177 (VGAM177) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11818] VGAM177 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM177 was detected is described hereinabove with reference to Figs. 1–8.

[11819] VGAM177 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM177 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11820] VGAM177 gene encodes a VGAM177 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM177 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM177 precursor RNA is designated SEQ

ID:163, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:163 is located at position 117656 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11821] VGAM177 precursor RNA folds onto itself, forming VGAM177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11822] An enzyme complex designated DICER COMPLEX, `dices` the VGAM177 folded precursor RNA into VGAM177 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM177 RNA is designated SEQ ID:2888, and

is provided hereinbelow with reference to the sequence listing part.

[11823] VGAM177 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM177 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM177 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11824] VGAM177 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM177 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM177 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM177 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM177 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11825] The complementary binding of VGAM177 RNA, herein designated VGAM RNA, to host target binding sites on VGAM177 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM177 host target RNA into VGAM177 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11826] It is appreciated that VGAM177 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM177 host target genes. The mRNA of each one of this plurality of VGAM177 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM177 RNA, herein designated VGAM RNA, and which when bound by VGAM177 RNA causes inhibition of translation of respective one or more VGAM177 host target proteins.

[11827] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM177 gene, herein designated VGAM GENE, on one or more VGAM177 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11828] It is yet further appreciated that a function of VGAM177 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM177 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM177 correlate with, and may be deduced from, the identity of the host target genes which VGAM177 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11829] Nucleotide sequences of the VGAM177 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM177 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM177 are further described hereinbelow with reference to Table 1.

[11830] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM177 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM177 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11831] As mentioned hereinabove with reference to Fig. 1, a function of VGAM177 gene, herein designated VGAM is inhibition of expression of VGAM177 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM177 correlate with, and may be deduced from, the identity of the target genes which VGAM177 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11832] Cytochrome C Oxidase Subunit VIIa Polypeptide 1 (muscle) (COX7A1, Accession NM_001864) is a VGAM177 host target gene. COX7A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by COX7A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX7A1 BINDING SITE, designated SEQ ID:7602, to the nucleotide sequence of VGAM177 RNA, herein designated VGAM RNA, also designated SEQ ID:2888.

[11833] A function of VGAM177 is therefore inhibition of Cytochrome C Oxidase Subunit VIIa Polypeptide 1 (muscle) (COX7A1, Accession NM_001864), a gene which is one of the nuclear-coded polypeptide chains of cytochrome c

oxidase. Accordingly, utilities of VGAM177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX7A1. The function of COX7A1 has been established by previous studies. Cytochrome c oxidase (COX; EC 1.9.3.1), the last component of the mitochondrial respiratory chain, catalyzes the transfer of electrons from reduced cytochrome c to molecular oxygen. In mammals, the apoprotein is composed of 3 large catalytic subunits, encoded by the mitochondrial genome (516030, 516040, and 516050), and by 10 smaller, nuclear-encoded subunits which may play a regulatory role. Subunit VIIa of mammalian COX exists in at least 2 isoforms, liver (L) and muscle (M). Arnaudo et al. (1992) isolated a full-length cDNA encoding the muscle isoform. The deduced polypeptide shares 78% identity with the bovine muscle form but only 63% identity with the human liver isoform. Northern blot analysis of primate tissues demonstrated that mRNA for the muscle form is present only in muscle tissues; in contrast, liver mRNA is present in both muscle and nonmuscle tissues. Southern blot analysis of human/rodent cell hybrid genomic DNA indicated that the muscle form is encoded by a single locus, designated COX7A1, on chromosome 19; in contrast,

cDNA probes for the liver isoform hybridized fragments from 2 loci, one on chromosome 4 (COX7A2; 123996) and the other on chromosome 14 (COX7A3; 123997 Fabrizio et al. (1989) reported the sequence of the human COX7A1 gene. Wolz et al. (1997) described the genomic sequence and organization of the human COX7A1 gene and compared it with its bovine homolog. The coding region of the gene extends over 1.45 kb of genomic sequence and is organized into 4 exons. Intron-exon boundaries are well conserved between cattle and humans. Although COX7A1 is a gene for a tissue-specific isoform, it has some features of a housekeeping gene: it is located in a CpG island, like its bovine homolog, and no TATA or CCAAT boxes are found in the 5-prime flanking sequence

[11834] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11835] Arnaudo, E.; Hirano, M.; Seelan, R. S.; Milatovich, A.; Hsieh, C.-L.; Fabrizio, G. M.; Grossman, L. I.; Francke, U.; Schon, E. A. : Tissue-specific expression and chromosome assignment of genes specifying two isoforms of subunit VIIa of human cytochrome c oxidase. Gene 119: 299-305, 1992. ; and

[11836] Fabrizi, G. M.; Rizzuto, R.; Nakase, H.; Mita, S.; Lomax, M. I.; Grossman, L. I.; Schon, E. A. : Sequence of a cDNA specifying subunit VIIa of human cytochrome c oxidase. Nucleic Acids R.

[11837] Further studies establishing the function and utilities of COX7A1 are found in John Hopkins OMIM database record ID 123995, and in cited publications numbered 87 and 3410–3411 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DNA (cytosine–5–)-methyltransferase 2 (DNMT2, Accession NM_004412) is another VGAM177 host target gene. DNMT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNMT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT2 BINDING SITE, designated SEQ ID:10669, to the nucleotide sequence of VGAM177 RNA, herein designated VGAM RNA, also designated SEQ ID:2888.

[11838] Another function of VGAM177 is therefore inhibition of DNA (cytosine–5–)-methyltransferase 2 (DNMT2, Accession NM_004412), a gene which may mark specific se–

quences in the genome . Accordingly, utilities of VGAM177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT2. The function of DNMT2 has been established by previous studies. Trace levels of 5-methylcytosine persist in the DNA of mouse embryonic stem cells that are homozygous for null mutations in Dnmt1 (OMIM Ref. No. 126375). Yoder and Bestor (1998) showed that this residual 5-methylcytosine may be the product of a second DNA methyltransferase, Dnmt2. Dnmt2 contains all the sequence motifs diagnostic of DNA (cytosine-5)-methyltransferases but appears to lack the large N-terminal regulatory domain common to other eukaryotic methyltransferases. It is more similar to a putative DNA methyltransferase of the fission yeast *Schizosaccharomyces pombe* than to Dnmt1. Dnmt2 produces multiple mRNA species that are present at low levels in all tissues of human and mouse and is not restricted to those cell types known to be active in de novo methylation. Yoder and Bestor (1998) mapped the human DNMT2 gene to 10p14-p12 in a panel of radiation hybrids. By fluorescence in situ hybridization, Vilain et al. (1998) assigned the DNMT2 gene to 10p15.1.

[11839] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11840] Vilain, A.; Apiou, F.; Dutrillaux, B.; Malfoy, B. : Assignment of candidate DNA methyltransferase gene (DNMT2) to human chromosome band 10p15.1 by in situ hybridization. Cytogenet. Cell Genet. 82: 120 only, 1998. ; and

[11841] Yoder, J. A.; Bestor, T. H. : A candidate mammalian DNA methyltransferase related to pmt1p of fission yeast. Hum. Molec. Genet. 7: 279–284, 1998.

[11842] Further studies establishing the function and utilities of DNMT2 are found in John Hopkins OMIM database record ID 602478, and in cited publications numbered 7961–7962 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072) is another VGAM177 host target gene. C1QR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1QR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QR1 BINDING SITE,

designated SEQ ID:14338, to the nucleotide sequence of VGAM177 RNA, herein designated VGAM RNA, also designated SEQ ID:2888.

[11843] Another function of VGAM177 is therefore inhibition of Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072). Accordingly, utilities of VGAM177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QR1. FLJ23511 (Accession NM_032239) is another VGAM177 host target gene. FLJ23511 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23511 BINDING SITE, designated SEQ ID:25965, to the nucleotide sequence of VGAM177 RNA, herein designated VGAM RNA, also designated SEQ ID:2888.

[11844] Another function of VGAM177 is therefore inhibition of FLJ23511 (Accession NM_032239). Accordingly, utilities of VGAM177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23511. KIAA0447 (Accession XM_049733) is another VGAM177

host target gene. KIAA0447 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0447 BINDING SITE, designated SEQ ID:35491, to the nucleotide sequence of VGAM177 RNA, herein designated VGAM RNA, also designated SEQ ID:2888.

[11845] Another function of VGAM177 is therefore inhibition of KIAA0447 (Accession XM_049733). Accordingly, utilities of VGAM177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0447. MSTP032 (Accession NM_025226) is another VGAM177 host target gene. MSTP032 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MSTP032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSTP032 BINDING SITE, designated SEQ ID:24906, to the nucleotide sequence of VGAM177 RNA, herein designated VGAM RNA, also designated SEQ ID:2888.

- [11846] Another function of VGAM177 is therefore inhibition of MSTP032 (Accession NM_025226). Accordingly, utilities of VGAM177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSTP032. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 178 (VGAM178) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [11847] VGAM178 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM178 was detected is described hereinabove with reference to Figs. 1–8.
- [11848] VGAM178 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM178 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [11849] VGAM178 gene encodes a VGAM178 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM178 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM178 precursor RNA is designated SEQ ID:164, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:164 is located at position 152069 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[11850] VGAM178 precursor RNA folds onto itself, forming VGAM178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11851] An enzyme complex designated DICER COMPLEX, `dices` the VGAM178 folded precursor RNA into VGAM178 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 60%) nucleotide sequence of VGAM178 RNA is designated SEQ ID:2889, and is provided hereinbelow with reference to the sequence listing part.

[11852] VGAM178 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM178 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM178 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[11853] VGAM178 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM178 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM178 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM178 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM178 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11854] The complementary binding of VGAM178 RNA, herein designated VGAM RNA, to host target binding sites on VGAM178 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM178 host target RNA into VGAM178 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11855] It is appreciated that VGAM178 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM178 host target genes. The mRNA of each one of this plurality of VGAM178 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM178 RNA, herein designated VGAM RNA, and which when bound by VGAM178 RNA causes inhibition of translation of respective one or more VGAM178 host target proteins.

[11856] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM178 gene, herein designated VGAM GENE, on one or more VGAM178 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[11857] It is yet further appreciated that a function of VGAM178 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM178 correlate with, and may be deduced from, the identity of the host target genes which VGAM178 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11858] Nucleotide sequences of the VGAM178 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM178 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM178 are further described hereinbelow with reference to Table 1.

[11859] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM178 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM178 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[11860] As mentioned hereinabove with reference to Fig. 1, a function of VGAM178 gene, herein designated VGAM is inhibition of expression of VGAM178 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM178 correlate with, and may be deduced from, the identity of the target genes which VGAM178 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11861] B-cell CLL/lymphoma 7A (BCL7A, Accession NM_020993) is a VGAM178 host target gene. BCL7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7A BINDING SITE, designated SEQ ID:21990, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11862] A function of VGAM178 is therefore inhibition of B-cell CLL/lymphoma 7A (BCL7A, Accession NM_020993). Accordingly, utilities of VGAM178 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with BCL7A. Calcium Channel, Voltage-dependent, Beta 1 Subunit (CACNB1, Accession NM_000723) is another VGAM178 host target gene. CACNB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CACNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNB1 BINDING SITE, designated SEQ ID:6384, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11863] Another function of VGAM178 is therefore inhibition of Calcium Channel, Voltage-dependent, Beta 1 Subunit (CACNB1, Accession NM_000723), a gene which may not only play an important role in the transport/insertion of the alpha-1S subunit into the membrane. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNB1. The function of CACNB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM114. Dual-specificity tyrosine-

(Y)–phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM_101395) is another VGAM178 host target gene. DYRK1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DYRK1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK1A BINDING SITE, designated SEQ ID:28161, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11864] Another function of VGAM178 is therefore inhibition of Dual–specificity tyrosine–(Y)–phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM_101395), a gene which regulates cell proliferation and may be involved in brain development . Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK1A. The function of DYRK1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42.ELK1, Member of ETS Oncogene Family (ELK1, Accession NM_005229) is another VGAM178 host target

gene. ELK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELK1 BINDING SITE, designated SEQ ID:11729, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11865] Another function of VGAM178 is therefore inhibition of ELK1, Member of ETS Oncogene Family (ELK1, Accession NM_005229), a gene which stimulates transcription. can form a ternary complex with the serum response factor and the ets and srf motifs of the fos serum response element. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELK1. The function of ELK1 has been established by previous studies. Rao et al. (1989) identified 2 new members of the ETS (164720, 164740) oncogene superfamily, ELK1 and ELK2. The ELK or related sequences appear to be transcriptionally active in testis and lung. By analysis of somatic cell hybrids and in situ hybridization, Rao et al. (1989) mapped the ELK1 gene to Xp11.2 and the ELK2 gene to 14q32.3. The former is near

the translocation breakpoint seen in t(X;18)(p11.2;q11.2), which is characteristic of synovial sarcoma; the latter is near the 14q32 breakpoint seen in ataxia–telangiectasia and other T–cell malignancies. Janz et al. (1994) used fluorescence in situ hybridization and a panel of tumor–derived somatic cell hybrids to assign the ELK1 gene to Xp11.4–p11.2, distal to the OATL1 region (OMIM Ref. No. 311240). Tamai et al. (1995) used interspecific backcross mice to map the Elk gene to the mouse X chromosome. Giovane et al. (1995) mapped ELK1 to human Xp11.2–p11.1 and to mouse XA1–A3 by in situ hybridization. Yamauchi et al. (1999) found by sequence analysis that the ELK2 locus on 14q32.2 that was identified by Rao et al. (1989) is actually a processed pseudogene (OMIM Ref. No. ELK2P1) of ELK1.

[11866] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11867] Tamai, Y.; Taketo, M.; Nozaki, M.; Seldin, M. F. : Mouse Elk oncogene maps to chromosome X and a novel Elk oncogene (Elk3) maps to chromosome 10. Genomics 26: 414–416, 1995. ; and

[11868] Yamauchi, T.; Toko, M.; Suga, M.; Hatakeyama, T.; Isobe,

M. : Structural organization of the human Elk1 gene and its processed pseudogene Elk2. DNA Res. 6: 21–27, 1999.

[11869] Further studies establishing the function and utilities of ELK1 are found in John Hopkins OMIM database record ID 311040, and in cited publications numbered 8627–8631 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Accession NM_004458) is another VGAM178 host target gene. FACL4 BINDING SITE1 and FACL4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FACL4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACL4 BINDING SITE1 and FACL4 BINDING SITE2, designated SEQ ID:10762 and SEQ ID:23252 respectively, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11870] Another function of VGAM178 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Accession NM_004458). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with FACL4. H1 Histone Family, Member 0 (H1F0, Accession NM_005318) is another VGAM178 host target gene. H1F0 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H1F0, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H1F0 BINDING SITE, designated SEQ ID:11794, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11871] Another function of VGAM178 is therefore inhibition of H1 Histone Family, Member 0 (H1F0, Accession NM_005318), a gene which is necessary for the condensation of nucleosome chains into higher order structures. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H1F0. The function of H1F0 has been established by previous studies. Histones are basic nuclear proteins that are responsible for the nucleosome structure within the chromosomal fiber in eukaryotes. See 142711. Doenecke and Tonjes (1986) cloned the human H1(0) gene. By PCR analysis of chromosomal DNA from a panel of human/ro-

dent somatic cell hybrids, Albig et al. (1993) demonstrated that the H1(0) subtype maps to chromosome 22. By fluorescence in situ hybridization, they further localized the gene to 22q13.1.

[11872] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11873] Albig, W.; Drabent, B.; Kunz, J.; Kalff-Suske, M.; Grzeschik, K.-H.; Doenecke, D. : All known human H1 histone genes except the H1(0) gene are clustered on chromosome 6. Genomics 16: 649-654, 1993. ; and

[11874] Doenecke, D.; Tonjes, R. : Differential distribution of lysine and arginine residues in the closely related histones H1 and H5. Analysis of a human H1 gene. J. Molec. Biol. 187: 461-464.

[11875] Further studies establishing the function and utilities of H1F0 are found in John Hopkins OMIM database record ID 142708, and in cited publications numbered 2672 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Homeo Box B9 (HOXB9, Accession NM_024017) is another VGAM178 host target gene. HOXB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

HOXB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXB9 BINDING SITE, designated SEQ ID:23445, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11876] Another function of VGAM178 is therefore inhibition of Homeo Box B9 (HOXB9, Accession NM_024017). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB9. Interleukin 11 (IL11, Accession NM_000641) is another VGAM178 host target gene. IL11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL11 BINDING SITE, designated SEQ ID:6278, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11877] Another function of VGAM178 is therefore inhibition of Interleukin 11 (IL11, Accession NM_000641), a gene which

stimulates the proliferation of hematopoietic stem cells and megakaryocyte progenitor cells and induces megakaryocyte maturation. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL11. The function of IL11 has been established by previous studies. Paul et al. (1990) identified and cloned the gene for a new stromal cell-derived lymphopoietic and hematopoietic cytokine which they called interleukin-11. The cDNA indicated a single reading frame of 597 nucleotides encoding a predicted 199-amino acid polypeptide. The IL11 produced in COS-1 cells showed an apparent molecular mass of about 23 kD. McKinley et al. (1992) determined that the genomic sequence is 7 kb long and consists of 5 exons and 4 introns. Biologic characterization indicated that in addition to stimulating plasmacytoma proliferation, IL11 stimulates T-cell-dependent development of immunoglobulin-producing B cells and collaborates with IL3 in supporting murine megakaryocyte colony formation (Paul et al., 1990). Du and Williams (1994) reviewed the pleiotropic effects of IL11 on hematopoietic cells. Yang-Feng et al. (1991) demonstrated by in situ hybridization that a cDNA for IL11 maps to 19q13.3-q13.4. Since

translocations involving 19q13 occur in patients with acute lymphocytic leukemia, the IL11 gene may be implicated. Du and Williams (1997) reviewed the molecular, cell biologic, and clinical aspects of interleukin-11.

[11878] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11879] Du, X.; Williams, D. A. : Interleukin-11: review of molecular, cell biology, and clinical use. Blood 89: 3897-3908, 1997. ; and

[11880] Du, X. X.; Williams, D. A. : Interleukin-11: a multifunctional growth factor derived from the hematopoietic microenvironment. Blood 83: 2023-2030, 1994.

[11881] Further studies establishing the function and utilities of IL11 are found in John Hopkins OMIM database record ID 147681, and in cited publications numbered 682-686 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Kelch-like 3 (Drosophila) (KLHL3, Accession XM_113450) is another VGAM178 host target gene. KLHL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL3 BINDING SITE, designated SEQ ID:42266, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11882] Another function of VGAM178 is therefore inhibition of Kelch-like 3 (Drosophila) (KLHL3, Accession XM_113450). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL3. MAD, Mothers Against Decapentaplegic Homolog 3 (Drosophila) (MADH3, Accession NM_005902) is another VGAM178 host target gene. MADH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MADH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADH3 BINDING SITE, designated SEQ ID:12522, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11883] Another function of VGAM178 is therefore inhibition of MAD, Mothers Against Decapentaplegic Homolog 3

(Drosophila) (MADH3, Accession NM_005902), a gene which affects transcription in response to TGF-beta signaling pathways. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADH3. The function of MADH3 has been established by previous studies. Zhang et al. (1996) showed that MADH3 and MADH4 (SMAD4; 600993) synergized to induce strong ligand-independent TGF-beta-like responses. MADH3 containing a C-terminal truncation acted as a dominant-negative inhibitor of the normal TGF-beta response. The activity of MADH3 was regulated by the TGF-beta receptors (e.g., 190181), and MADH3 was phosphorylated and associated with the ligand-bound receptor complex. Zhang et al. (1996) stated that these results define MADH3 as an effector of the TGF-beta response. Zawel et al. (1998) found that human SMAD3 and SMAD4 proteins could specifically recognize an identical 8-bp palindromic sequence (GTCTAGAC). Tandem repeats of this palindrome conferred striking TGF-beta responsiveness to a minimal promoter. This responsiveness was abrogated by targeted deletion of the cellular SMAD4 gene. These results showed that SMAD proteins are involved in the biologic Animal

model experiments lend further support to the function of MADH3. Zhu et al. (1998) reported the targeted disruption of the mouse Smad3 gene. Smad3 mutant mice were viable and fertile. Between 4 and 6 months of age, the Smad3 mutant mice became moribund with colorectal adenocarcinomas. The neoplasms penetrated through the intestinal wall and metastasized to lymph nodes. Since TGF-beta transduces its signal to the interior of the cell via Smad2, Smad3, and Smad4, these results directly implicate TGF-beta signaling in the pathogenesis of colorectal cancer and provide a compelling animal model for the study of human colorectal cancer

[11884] It is appreciated that the abovementioned animal model for MADH3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[11885] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11886] Zawel, L.; Dai, J. L.; Buckhaults, P.; Zhou, S.; Kinzler, K. W.; Vogelstein, B.; Kern, S. E. : Human Smad3 and Smad4 are sequence-specific transcription activators. Molec. Cell 1: 611-617, 1998. ; and

[11887] Zhu, Y.; Richardson, J. A.; Parada, L. F.; Graff, J. M. :
Smad3 mutant mice develop metastatic colorectal cancer.
Cell 94: 703–714, 1998.

[11888] Further studies establishing the function and utilities of
MADH3 are found in John Hopkins OMIM database record
ID 603109, and in cited publications numbered 8579,
12349, 6480, 7824, 783 and 8580–8581 listed in the
bibliography section hereinbelow, which are also hereby
incorporated by reference. Microtubule-associated Protein,
RP/EB Family, Member 2 (MAPRE2, Accession NM_014268)
is another VGAM178 host target gene. MAPRE2 BINDING
SITE is HOST TARGET binding site found in the 3` un-
translated region of mRNA encoded by MAPRE2, corre-
sponding to a HOST TARGET binding site such as BINDING
SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-
trates the complementarity of the nucleotide sequences of
MAPRE2 BINDING SITE, designated SEQ ID:15545, to the
nucleotide sequence of VGAM178 RNA, herein designated
VGAM RNA, also designated SEQ ID:2889.

[11889] Another function of VGAM178 is therefore inhibition of
Microtubule-associated Protein, RP/EB Family, Member 2
(MAPRE2, Accession NM_014268), a gene which The func-
tional inactivation of the APC gene product is a key event

in colorectal tumorigenesis. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE2. The function of MAPRE2 has been established by previous studies. EB1 family proteins (e.g., MAPRE1; 603108) interact with cytoplasmic microtubules in interphase cells, with mitotic spindles, and with the adenomatous polyposis coli (APC; 175100) tumor suppressor gene. The functional inactivation of the APC gene product is a key event in colorectal tumorigenesis. By differential mRNA display of resting and activated T cells, followed by 5-prime RACE, Renner et al. (1997) isolated a cDNA encoding MAPRE2, which they termed RP1. The deduced 327-amino acid protein has significant homology with EB1 family proteins. Northern blot analysis detected a 2.6-kb transcript in T cells activated by 2 signals (i.e., cell surface antigen(s) and/or cytokine) and also in lymphocyte tumor cell lines. Immunoprecipitation analysis indicated that RP1 associates with full-length but not C terminus-deleted APC. Renner et al. (1997) concluded that RP1 may be an immediate-early T-cell regulatory gene. Using immunoprecipitation analysis, Juwana et al. (1999) showed that the N terminus of RP1 interacted with monomeric or polymer-

ized tubulin in fibrosarcoma cell lines. Immunofluorescence microscopy demonstrated that RP1 is localized in the plus ends of microtubule networks in the presence or absence of APC. By radiation hybrid and sequence analyses, Su and Qi (2001) mapped the MAPRE2 gene to 18q12. By FISH, Wadle et al. (2001) assigned the gene to 18q21.

[11890] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11891] Juwana, J.-P.; Henderikx, P.; Mischo, A.; Wadle, A.; Fadle, N.; Gerlach, K.; Arends, J. W.; Hoogenboom, H.; Pfreundschuh, M.; Renner, C. : EB/RP gene family encodes tubulin binding proteins. *Int. J. Cancer* 81: 275–284, 1999. ; and

[11892] Renner, C.; Pfitzenmeier, J.-P.; Gerlach, K.; Held, G.; Ohnesorge, S.; Sahin, U.; Bauer, S.; Pfreundschuh, M. : RP1, a new member of the adenomatous polyposis coli-binding EB1-like gen.

[11893] Further studies establishing the function and utilities of MAPRE2 are found in John Hopkins OMIM database record ID 605789, and in cited publications numbered 734–73 and 8578 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Microtubule-associated Protein Tau (MAPT, Acces-

sion NM_005910) is another VGAM178 host target gene. MAPT BINDING SITE1 through MAPT BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPT BINDING SITE1 through MAPT BINDING SITE4, designated SEQ ID:12538, SEQ ID:18826, SEQ ID:18832 and SEQ ID:18838 respectively, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11894] Another function of VGAM178 is therefore inhibition of Microtubule-associated Protein Tau (MAPT, Accession NM_005910), a gene which Microtubule-associated protein tau; promotes microtubule assembly. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPT. The function of MAPT has been established by previous studies. The microtubule-associated proteins (MAPs) coassemble with tubulin (see OMIM Ref. No. 602529) into microtubules in vitro. Microtubule-associated protein tau appears to be enriched in axons. Neve et

al. (1986) identified tau cDNA clones in a human fetal brain cDNA library. The clones recognized a 6-kb message that was expressed in human brain but not in other human tissues and exhibited a developmental shift in size. By screening cDNA libraries prepared from the frontal cortex of an Alzheimer disease patient and from fetal human brain, Goedert et al. (1988) isolated the cDNA for a core protein of the paired helical filament of Alzheimer disease (OMIM Ref. No. 104300). The partial amino acid sequence of this core protein was used to design synthetic oligonucleotide probes. The cDNA encodes a protein of 352 amino acids that contains a characteristic amino acid repeat in its carboxyl-terminal half. Because of extensive homology to the sequence of the mouse microtubule-associated protein tau, they stated that this protein must constitute the human equivalent of mouse tau. Tau protein mRNA was found in normal amounts in the frontal cortex from patients with Alzheimer disease. Hutton et al. (1998) studied 13 families in which an autosomal dominant inherited dementia, frontotemporal dementia with parkinsonism (OMIM Ref. No. 600274), had been shown to be linked to chromosome 17. The authors stated that this disorder has historically been termed Pick dis-

ease (OMIM Ref. No. 172700). Most cases showed neuronal and/or glial inclusions that stained positively with antibodies raised against tau, although the tau pathology varied considerably in both its quantity (or severity) and characteristics. This form of dementia, symbolized FTDP17 by them, had been mapped to a 2-cM region on 17q21.11. Since the tau gene was known to lie within this region and because the disorder was recognized to be a 'tauopathy,' Hutton et al. (1998) sequenced the MAPT gene in the thirteen 17-linked families and identified 3 missense mutations (gly272 to val, 157140.0002; pro301 to leu, 157140.0001; and arg406 to trp, 157140.0003) and 3 mutations in the 5-prime splice site of exon 10. All of the splice site mutations destabilized a potential stem-loop structure that is probably involved in regulating the alternative splicing of exon 10 (Goedert et al., 1989). This caused more frequent usage of the 5-prime splice site and an increased proportion of tau transcripts that include exon 10. The increase in exon 10+ mRNA was expected to increase the proportion of tau containing 4 microtubule-binding repeats, which is consistent with the neuropathology described in families with FTDP17. Hong et al. (1998) indicated that more than 10 exonic and intronic

mutations of the MAPT gene had been identified in about 20 FTDP17 families. They found that analyses of soluble and insoluble tau proteins from brains of FTDP17 patients indicated that different pathogenic mutations differentially altered distinct biochemical properties and stoichiometry of brain tau isoforms. Functional assays of recombinant tau proteins with different FTDP17 missense mutations implicated all but 1 of these mutations in disease pathogenesis by reducing the ability of tau to bind microtubules and promote microtubule assembly. In a study of frontotemporal dementia in the Netherlands during the period January 1994 to June 1998, Rizzu et al. (1999) found 37 patients who had one or more first-degree relatives with dementia. A mutation in the MAPT gene was found in 17.8% of the group of patients with FTDP17 and in 43% of patients with FTDP17 who also had a positive family history of the disorder. Three distinct missense mutations, G272V (157140.0002), P301L (157140.0001), and R406W (157140.0003), accounted for 15.6% of the mutations. These 3 missense mutations, and a single amino acid deletion, K280del, that was detected in 1 patient, strongly reduced the ability of tau to promote microtubule assembly. In some FTDP17 families, MAPT mutations have not

been found, suggesting locus and/or allelic heterogeneity. Rizzu et al. (1999) suggested that the MAPT mutations may result in disturbances in the interactions of the protein tau with microtubules, resulting in hyperphosphorylation of tau protein, assembly into filaments, and subsequent cell death. Verpillat et al. (2002) found that the tau H1/H1 genotype was significantly overrepresented in 100 patients with frontotemporal dementia compared to controls (odds ratio for H1/H1 = 1.95). In addition, there was a significant negative effect in carriers of both the H1/H1 genotype and the APOE2 allele (OMIM Ref. No. 107741). The association of intronic mutations in the MAPT gene in frontotemporal dementia with parkinsonism (e.g., 157140.0004) highlights the involvement of aberrant pre-mRNA splicing in the pathogenesis of neurodegenerative disorders. To establish a model system for studying the role of pre-mRNA splicing in neurodegenerative diseases, Jiang et al. (2000) constructed a MAPT minigene that reproduced alternative splicing in both cultured cells and in vitro biochemical assays. They demonstrated that mutations in a nonconserved intronic region of the human MAPT gene led to increased splicing between exons 10 and 11. Systematic biochemical analyses indicated the im-

portance of U1 snRNP (OMIM Ref. No. 180740) and, to a lesser extent, U6 snRNP (OMIM Ref. No. 180692) in differentially recognizing wildtype versus intron-mutant MAPT pre-mRNAs. Goedert et al. (1998) reviewed the role of tau mutations in frontotemporal dementias. Heutink (2000) reviewed the role of tau protein in frontotemporal dementia and other neurodegenerative disorders. Hutton (2001) reviewed the known missense and splice site mutations in the tau gene that are associated with disease and described different mechanisms involved in pathogenesis, including disruption of the interaction between tau and tubulin, deposition of abnormal tau filaments, and the generation of abnormal ratios of tau isoforms. Animal model experiments lend further support to the function of MAPT. Lewis et al. (2000) demonstrated that expression of human tau containing the most common mutation, P301L (157140.0001), results in motor and behavioral deficits in transgenic mice, with age- and gene-dose-dependent development of neurofibrillary tangles (NFT).

[11895] It is appreciated that the abovementioned animal model for MAPT is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[11896] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11897] Hutton, M.; Lendon, C. L.; Rizzu, P.; Baker, M.; Froelich, S.; Houlden, H.; Pickering-Brown, S.; Chakraverty, S.; Isaacs, A.; Grover, A.; Hackett, J.; Adamson, J.; and 39 others : Association of missense and 5-prime-splice-site mutations in tau with the inherited dementia FTDP-17. *Nature* 393: 702-705, 1998. ; and

[11898] Rizzu, P.; Van Swieten, J. C.; Joosse, M.; Hasegawa, M.; Stevens, M.; Tibben, A.; Niermeijer, M. F.; Hillebrand, M.; Ravid, R.; Oostra, B. A.; Goedert, M.; van Duijn, C. M.; Heutink, P.

[11899] Further studies establishing the function and utilities of MAPT are found in John Hopkins OMIM database record ID 157140, and in cited publications numbered 11119-11133, 1212, 11134-11142, 11160, 11165-11164, 413 and 11166-1683 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Membrane Protein, Palmitoylated 3 (MAGUK p55 subfamily member 3) (MPP3, Accession NM_001932) is another VGAM178 host target gene. MPP3 BINDING SITE is HOST TARGET binding site found in the

5` untranslated region of mRNA encoded by MPP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPP3 BINDING SITE, designated SEQ ID:7641, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11900] Another function of VGAM178 is therefore inhibition of Membrane Protein, Palmitoylated 3 (MAGUK p55 subfamily member 3) (MPP3, Accession NM_001932). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPP3. Musashi Homolog 1 (Drosophila) (MSI1, Accession NM_002442) is another VGAM178 host target gene. MSI1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MSI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSI1 BINDING SITE, designated SEQ ID:8283, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11901] Another function of VGAM178 is therefore inhibition of

Musashi Homolog 1 (Drosophila) (MSI1, Accession NM_002442). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSI1. Myosin, Heavy Polypeptide 11, Smooth Muscle (MYH11, Accession NM_002474) is another VGAM178 host target gene. MYH11 BINDING SITE1 and MYH11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MYH11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYH11 BINDING SITE1 and MYH11 BINDING SITE2, designated SEQ ID:8301 and SEQ ID:23143 respectively, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11902] Another function of VGAM178 is therefore inhibition of Myosin, Heavy Polypeptide 11, Smooth Muscle (MYH11, Accession NM_002474), a gene which is involved in muscle contraction. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH11. The function of MYH11 has been established by previous studies. Mat-

suoka et al. (1991, 1993) isolated a smooth muscle myosin heavy-chain gene from a human cDNA library. They confirmed it as a smooth muscle MHC gene by Northern blot hybridization and a partial DNA sequence analysis. By study of human/Chinese hamster and human/mouse hybrid cells and by in situ hybridization, they localized the gene to 16q12.1. This localization was later found to be an error and the gene was shown, in fact, to be located on the short arm of chromosome 16 in a region involved in pericentric inversion inv(16)(OMIM Ref. No. p13q22), a characteristic abnormality associated with acute myeloid leukemia, most commonly of the M4Eo subtype. Liu et al. (1993) pinpointed the 16p and 16q breakpoints by yeast artificial chromosome and cosmid cloning and identified the 2 genes involved in the inversion. On 16p, the MYH11 gene was interrupted; on 16q, the inversion occurred near the end of the coding region for CBF-beta (OMIM Ref. No. 121360), also known as PEBP2-beta, a subunit of a heterodimeric transcription factor regulating genes expressed in T cells. In all of 6 inv(16) patients tested, an in-frame fusion messenger RNA was demonstrated that connected the first 165 amino acids of CBFB with the tail region of MYH11. The repeated

coiled coil of MYH11 may result in dimerization of the CBFB fusion protein, which in turn would lead to alterations in transcriptional regulation and contribute to leukemic transformation. Deng et al. (1993) mapped the MYH11 gene to the middle of the short arm of chromosome 16 by fluorescence in situ hybridization. Southern blots of a panel of hybrids containing different portions of human chromosome 16 localized the gene to 16p13.13–p13.12. Studies of DNA from a CHO/mouse hybrid clone mapping panel showed that the gene was located on mouse chromosome 16. Castilla et al. (1999) showed that the fusion Cbfb–MYH11 blocks myeloid differentiation in mice and predisposes the mice to acute myelomonocytic leukemia when exposed to N-ethyl–N-nitrosourea (ENU), a potent DNA alkylating mutagen.

[11903] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11904] Castilla, L. H.; Garrett, L.; Adya, N.; Orlic, D.; Dutra, A.; Anderson, S.; Owens, J.; Eckhaus, M.; Bodine, D.; Liu, P. P. : The fusion gene Cbfb–MYH11 blocks myeloid differentiation and predisposes mice to acute myelomonocytic

leukaemia. (Letter) Nature Genet. 23: 144–146, 1999. ;
and

[11905] Liu, P.; Tarle, S. A.; Hajra, A.; Claxton, D. F.; Marlton, P.;
Freedman, M.; Siciliano, M. J.; Collins, F. S. : Fusion be-
tween transcription factor CBF-beta/PEBP2-beta and a
myosin heav.

[11906] Further studies establishing the function and utilities of
MYH11 are found in John Hopkins OMIM database record
ID 160745, and in cited publications numbered
3222–3223, 3403, 460 and 4607 listed in the bibliogra-
phy section hereinbelow, which are also hereby incorpo-
rated by reference. Neurexin 2 (NRXN2, Accession
NM_138732) is another VGAM178 host target gene.
NRXN2 BINDING SITE1 through NRXN2 BINDING SITE3 are
HOST TARGET binding sites found in untranslated regions
of mRNA encoded by NRXN2, corresponding to HOST
TARGET binding sites such as BINDING SITE I, BINDING
SITE II or BINDING SITE III. Table 2 illustrates the comple-
mentarity of the nucleotide sequences of NRXN2 BINDING
SITE1 through NRXN2 BINDING SITE3, designated SEQ
ID:28981, SEQ ID:28987 and SEQ ID:17465 respectively,
to the nucleotide sequence of VGAM178 RNA, herein des-
ignated VGAM RNA, also designated SEQ ID:2889.

[11907] Another function of VGAM178 is therefore inhibition of Neurexin 2 (NRXN2, Accession NM_138732), a gene which may be involved in cell recognition, cell adhesion, and may mediate intracellular signaling. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRXN2. The function of NRXN2 has been established by previous studies. Neurexins are polymorphic cell surface proteins that are expressed in neurons. Neurexin II is 1 of 3 rat neurexin genes identified by Ushkaryov et al. (1992). Each gene contains 2 promoters that direct synthesis of alpha- and beta-neurexins. By analysis of a 1.2-Mb region flanking the MEN1 (OMIM Ref. No. 131100) locus on 11q13, Bergman et al. (1999) identified MCG36, a human gene similar to rat neurexin II-alpha. By genomic sequence analysis, Tabuchi and Sudhof (2002) determined that the NRXN2 gene contains 23 exons, has very large introns, and spans 106 kb, making it a relatively small gene compared to NRXN1 (OMIM Ref. No. 600565) and NRXN3. Exon 1 is more than 2 kb and encodes the first LNS domain and the first EGF-like repeat of alpha-neurexins. Other exons are average in size, with the remaining LNS domains interrupted by at least 1 intron, whereas all EGF-

like repeats are encoded in single exons. The last exon, also relatively large, encodes the transmembrane region and cytoplasmic tail. Tabuchi and Sudhof (2002) also described a number of neurexin splice sites.

[11908] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11909] Bergman, L.; Silins, G.; Grimmond, S.; Hummerich, H.; Stewart, C.; Little, P.; Hayward, N. : A 500-kb sequence-ready cosmid contig and transcript map of the MEN1 region on 11q13. *Genomics* 55: 49–56, 1999. ; and

[11910] Tabuchi, K.; Sudhof, T. C. : Structure and evolution of neurexin genes: insight into the mechanism of alternative splicing. *Genomics* 79: 849–859, 2002.

[11911] Further studies establishing the function and utilities of NRXN2 are found in John Hopkins OMIM database record ID 600566, and in cited publications numbered 9529, 9525–952 and 9530 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAD23 Homolog B (*S. cerevisiae*) (RAD23B, Accession NM_002874) is another VGAM178 host target gene.

RAD23B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

RAD23B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD23B BINDING SITE, designated SEQ ID:8784, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11912] Another function of VGAM178 is therefore inhibition of RAD23 Homolog B (*S. cerevisiae*) (RAD23B, Accession NM_002874), a gene which is involved in dna excision repair. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD23B. The function of RAD23B has been established by previous studies. Volker et al. (2001) described the assembly of the nucleotide excision repair (NER) complex in normal and repair-deficient (xeroderma pigmentosum) human cells by employing a novel technique of local ultraviolet irradiation combined with fluorescent antibody labeling. The damage-recognition complex XPC-HHR23B (OMIM Ref. No. RAD23B) appeared to be essential for the recruitment of all subsequent NER factors in the preincision complex, including transcription repair factor TFIIH (see OMIM Ref.

No. 189972). The authors found that XPA (OMIM Ref. No. 278700) associates relatively late, is required for anchoring of ERCC1 (OMIM Ref. No. 126380)–XPF (OMIM Ref. No. 133520), and may be essential for activation of the endonuclease activity of XPG (OMIM Ref. No. 133530). These findings identified XPC as the earliest known NER factor in the reaction mechanism, gave insight into the order of subsequent NER components, provided evidence for a dual role of XPA, and supported a concept of sequential assembly of repair proteins at the site of damage rather than a preassembled repairosome. Animal model experiments lend further support to the function of RAD23B. Ng et al. (2002) created a Rad23B knockout mouse model. Fibroblasts cultured from embryonic animals were not UV sensitive and retained the repair characteristics of wild-type cells, suggesting that Rad23A can functionally replace Rad23B in NER. However, there was a high rate of intrauterine or neonatal death in Rad23B $-/-$ animals, and surviving animals displayed a variety of abnormalities, including retarded growth, facial dysmorphology, and male sterility. These findings suggested a function for Rad23B in normal development that cannot be compensated for by Rad23A.

- [11913] It is appreciated that the abovementioned animal model for RAD23B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

- [11917] Further studies establishing the function and utilities of RAD23B are found in John Hopkins OMIM database record ID 600062, and in sited publications numbered 8410, 8793–879 and 8249 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAD50 Homolog (*S. cerevisiae*) (RAD50, Accession NM_005732) is another VGAM178 host target gene.

RAD50 BINDING SITE1 and RAD50 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD50, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD50 BINDING SITE1 and RAD50 BINDING SITE2, designated SEQ ID:12293 and SEQ ID:28550 respectively, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11918] Another function of VGAM178 is therefore inhibition of RAD50 Homolog (*S. cerevisiae*) (RAD50, Accession NM_005732), a gene which is involved in dna double-strand break repair (dsbr). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD50. The function of RAD50 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132.RAR-related Orphan Receptor B (RORB, Accession NM_006914) is another VGAM178 host target gene. RORB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

RORB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RORB BINDING SITE, designated SEQ ID:13785, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11919] Another function of VGAM178 is therefore inhibition of RAR-related Orphan Receptor B (RORB, Accession NM_006914), a gene which is an orphan nuclear receptor. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RORB. The function of RORB has been established by previous studies. ROR-beta is a transcription factor and belongs to the nuclear receptor family (Carlberg et al., 1994). Members of this superfamily share a common modular structure composed of a transactivation domain, a DNA-binding domain, and a ligand-binding domain (Evans, 1988). Typically, their transcriptional transactivation function is regulated by small lipophilic molecules, such as steroid hormones, vitamin D, retinoic acids, and thyroid hormone. These molecules are synthesized in the organism and pass readily through the plasma membrane to reach the corresponding receptors

inside the cell. In addition to the classic hormone receptors, a growing number of nuclear receptors for which no ligands are known have been identified by homology cloning. These nuclear receptors are referred to as 'orphan' nuclear receptors. ROR-beta is such an orphan nuclear receptor, forming a subfamily with the closely related nuclear receptors ROR-alpha (RORA; 600825) and ROR-gamma (RORC; 602943). Animal model experiments lend further support to the function of RORB. ROR-beta is expressed in areas of the central nervous system that are involved in the processing of sensory information, including spinal cord, thalamus, and sensory cerebellar cortices. Additionally, ROR-beta localizes to the 3 principal anatomic components of the mammalian timing system: the suprachiasmatic nuclei, the retina, and the pineal gland. Andre et al. (1998) showed that RORB mRNA levels oscillate in retina and pineal gland with a circadian rhythm that persists in constant darkness. They generated RORB-deficient mice by gene targeting in embryonic stem cells and analyzed their phenotypic behavior. Rorb $-/-$ mice display a duck-like gait, transient male incapability to reproduce sexually, and a severely disorganized retina that suffers from postnatal degeneration. Consequently, adult

Rorb $-/-$ mice are blind, yet their circadian activity rhythm is still entrained by light-dark cycles. Under conditions of constant darkness, Rorb $-/-$ mice display an extended period of free-running rhythmicity. The overall behavioral phenotype of Rorb $-/-$ mice, together with the chromosomal localization of the gene on mouse chromosome 4, suggested a close relationship to the spontaneous mouse mutation 'vacillans' described by Sirlin (1956) and now thought to be extinct

[11920] It is appreciated that the abovementioned animal model for RORB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[11921] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11922] Evans, R. M. : The steroid and thyroid hormone receptor superfamily. Science 240: 889–895, 1988. ; and

[11923] Andre, E.; Conquet, F.; Steinmayr, M.; Stratton, S. C.; Porciatti, V.; Becker-Andre, M. : Disruption of retinoid-related orphan receptor beta changes circadian behavior, causes retinal deg.

[11924] Further studies establishing the function and utilities of

RORB are found in John Hopkins OMIM database record ID 601972, and in cited publications numbered 8522, 8523–852 and 7778 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Smoothed Homolog (Drosophila) (SMOH, Accession NM_005631) is another VGAM178 host target gene. SMOH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMOH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMOH BINDING SITE, designated SEQ ID:12161, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11925] Another function of VGAM178 is therefore inhibition of Smoothed Homolog (Drosophila) (SMOH, Accession NM_005631). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOH. Suppression of Tumorigenicity 7 (ST7, Accession NM_021908) is another VGAM178 host target gene. ST7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by ST7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST7 BINDING SITE, designated SEQ ID:22428, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11926] Another function of VGAM178 is therefore inhibition of Suppression of Tumorigenicity 7 (ST7, Accession NM_021908), a gene which has a role in regulating cell-environment or cell-cell interactions. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7. The function of ST7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. Synaptogyrin 1 (SYNGR1, Accession NM_004711) is another VGAM178 host target gene. SYNGR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SYNGR1 BINDING SITE, designated SEQ ID:11061, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11927] Another function of VGAM178 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NM_004711), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1. The function of SYNGR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. Transcription Factor 2, Hepatic; LF-B3; Variant Hepatic Nuclear Factor (TCF2, Accession NM_006481) is another VGAM178 host target gene. TCF2 BINDING SITE1 and TCF2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCF2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF2 BINDING SITE1 and TCF2 BINDING SITE2, designated SEQ ID:13199 and SEQ

ID:6073 respectively, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11928] Another function of VGAM178 is therefore inhibition of Transcription Factor 2, Hepatic; LF-B3; Variant Hepatic Nuclear Factor (TCF2, Accession NM_006481), a gene which probably binds to the inverted palindrome 5'-gttaatnattaac-3'. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF2. The function of TCF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM118.Transforming Growth Factor, Beta 1 (Camurati-Engelmann disease) (TGFB1, Accession NM_000660) is another VGAM178 host target gene. TGFB1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TGFB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB1 BINDING SITE, designated SEQ ID:6318, to the nucleotide sequence of VGAM178 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:2889.

[11929] Another function of VGAM178 is therefore inhibition of Transforming Growth Factor, Beta 1 (Camurati-Engelmann disease) (TGFB1, Accession NM_000660). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB1. Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM_049695) is another VGAM178 host target gene. VANGL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VANGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VANGL2 BINDING SITE, designated SEQ ID:35475, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11930] Another function of VGAM178 is therefore inhibition of Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM_049695), a gene which may take part in defining the lateral boundary of floorplate differentiation. Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with VANGL2. The function of VANGL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111. Wingless-type MMTV Integration Site Family Member 2 (WNT2, Accession NM_003391) is another VGAM178 host target gene. WNT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT2 BINDING SITE, designated SEQ ID:9427, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11931] Another function of VGAM178 is therefore inhibition of Wingless-type MMTV Integration Site Family Member 2 (WNT2, Accession NM_003391), a gene which is the ligand for members of the frizzled family of seven transmembrane receptors. probable developmental protein and may be a signaling molecule . Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT2. The function of WNT2 has been established by previous

studies. Wainwright et al. (1988) cloned from a human lung cDNA library an expressed gene sequence that was identified by isolation of a methylation-free CpG island from human chromosome 7. (Bird et al. (1985) described so-called HTF (HpaII tiny fragments) islands which are relatively rich in G/C and virtually free of methylation at the CpG dinucleotide. Such regions usually occur at discrete units, 1 to 2 kb long, which can be detected by analysis with methylation-sensitive restriction enzymes. HTF islands are particularly associated with the site of initiation of transcription and the first exons of genes. Both tissue-specific and housekeeping genes have been described in association with HTF islands (Bird, 1987). The characteristics of HTF islands make it possible to isolate selectively regions of the genome that are likely to contain structural genes.) As part of the strategy to isolate the gene for cystic fibrosis (OMIM Ref. No. 219700), Wainwright et al. (1988) found and characterized a coding sequence with marked similarity to the murine protooncogene *Int1* and its *Drosophila* homolog 'wingless,' but which was distinct from the human *INT1* gene located on chromosome 12 (OMIM Ref. No. 164820). Indirect evidence that *INT1* is secreted and that the product of 'wingless' is a diffusible

gene product suggests that these proteins are secreted growth factors. Wainwright et al. (1988) suggested that the INT1-related protein is an additional member of the INT1 growth factor gene family. Because of its homology to protooncogene INT1, IRP is also symbolized INT1L1. IRP is expressed in a variety of fetal and adult human tissues that do not overlap with the pattern of expression of INT1. Chan et al. (1989) isolated overlapping genomic clones that correspond to the mouse homolog of the IRP gene and demonstrated in mouse-hamster somatic cell hybrids that the gene is located on mouse chromosome 6. In addition, they showed that the mouse *Int1l1* and *Met* genes coamplified in lines of spontaneously transformed mouse NIH 3T3 cells, indicating that these genes are closely linked. IRP is about 500 kb from MET (OMIM Ref. No. 164860); the CFTR gene (OMIM Ref. No. 602421) is in the 500-kb interval between IRP and a point 1,000 kb from MET. Anonymous probe J3.11 is about 500 kb farther distally. Nusse et al. (1991) suggested that IRP be referred to as WNT2. Wassink et al. (2001) examined WNT2 as a candidate gene for autism (OMIM Ref. No. 209850) for the following reasons: first, the WNT family of genes influences the development of numerous organs and systems,

including the central nervous system; second, WNT2 is located in the 7q31–q33 region linked to autism and is adjacent to a chromosomal breakpoint in an individual with autism; third, a mouse knockout of the dishevelled–1 (DVL1; 601365) gene, a member of a gene family essential for the function of the WNT pathway, exhibits a behavioral phenotype characterized primarily by diminished social interaction. Wassink et al. (2001) found 2 families containing nonconservative coding sequence variants that segregated with autism. They also identified linkage disequilibrium between a WNT2 3–prime–untranslated region single nucleotide polymorphism (SNP) and their sample of autism–affected sib pair families and trios (2 parents and 1 affected child). Linkage disequilibrium occurred almost exclusively in a subgroup of affected sib pair families defined by the presence of severe language abnormalities and was also found to be associated with evidence for linkage to 7q. Expression analysis demonstrated WNT2 expression in the human thalamus. Using ribonuclease protection analysis, Huguet et al. (1994) investigated expression of WNT genes, including WNT2, in human cell lines, as well as in normal, benign, and malignant breast tissue. They detected WNT2 in human breast tissue and

hypothesized that WNT2 may be associated with abnormal proliferation in breast tissue. In a later study, McCoy et al. (2002) could find no significant association between autistic disorder and WNT2 genotypes in either an overall dataset or a language-impaired subset of families. No activating mutation in the coding region of WNT2 was found.

[11932] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11933] Wainwright, B. J.; Scambler, P. J.; Stanier, P.; Watson, E. K.; Bell, G.; Wicking, C.; Estivill, X.; Courtney, M.; Bour, A.; Pedersen, P. S.; Williamson, R.; Farrall, M. : Isolation of a human gene with protein sequence similarity to human and murine int-1 and the Drosophila segment polarity mutant wingless. EMBO J. 7: 1743–1748, 1988. ; and

[11934] Wassink, T. H.; Piven, J.; Vieland, V. J.; Huang, J.; Swiderski, R. E.; Pietila, J.; Braun, T.; Beck, G.; Folstein, S. E.; Haines, J. L.; Sheffield, V. C. : Evidence supporting WNT2 as a.

[11935] Further studies establishing the function and utilities of WNT2 are found in John Hopkins OMIM database record ID 147870, and in cited publications numbered 3469, 392

and 3968–3973 listed in the bibliography section herein–below, which are also hereby incorporated by reference. BIKE (Accession NM_017593) is another VGAM178 host target gene. BIKE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIKE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIKE BINDING SITE, designated SEQ ID:19038, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11936] Another function of VGAM178 is therefore inhibition of BIKE (Accession NM_017593). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIKE. Baculoviral IAP Repeat–containing 4 (BIRC4, Accession NM_001167) is another VGAM178 host target gene. BIRC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIRC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

BIRC4 BINDING SITE, designated SEQ ID:6834, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11937] Another function of VGAM178 is therefore inhibition of Baculoviral IAP Repeat-containing 4 (BIRC4, Accession NM_001167). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC4. Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM_018152) is another VGAM178 host target gene. C20orf12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf12 BINDING SITE, designated SEQ ID:19957, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11938] Another function of VGAM178 is therefore inhibition of Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM_018152). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with C20orf12. Calpain 6 (CAPN6, Accession NM_014289) is another VGAM178 host target gene. CAPN6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN6 BINDING SITE, designated SEQ ID:15566, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11939] Another function of VGAM178 is therefore inhibition of Calpain 6 (CAPN6, Accession NM_014289). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN6. Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_013989) is another VGAM178 host target gene. DIO2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DIO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE, designated SEQ ID:15175,

to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11940] Another function of VGAM178 is therefore inhibition of Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_013989). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. DKFZP434H132 (Accession XM_057020) is another VGAM178 host target gene. DKFZP434H132 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434H132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:36444, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11941] Another function of VGAM178 is therefore inhibition of DKFZP434H132 (Accession XM_057020). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132. DKFZP434L0718 (Accession NM_032139) is another VGAM178 host target gene. DK-

FZP434L0718 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434L0718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L0718 BINDING SITE, designated SEQ ID:25819, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11942] Another function of VGAM178 is therefore inhibition of DKFZP434L0718 (Accession NM_032139). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L0718. DKFZp547O146 (Accession NM_020224) is another VGAM178 host target gene. DKFZp547O146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp547O146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547O146 BINDING SITE, designated SEQ ID:21486, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2889.

[11943] Another function of VGAM178 is therefore inhibition of DKFZp547O146 (Accession NM_020224). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547O146. Ephrin-A5 (EFNA5, Accession NM_001962) is another VGAM178 host target gene. EFNA5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EFNA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNA5 BINDING SITE, designated SEQ ID:7684, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11944] Another function of VGAM178 is therefore inhibition of Ephrin-A5 (EFNA5, Accession NM_001962). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNA5. FLJ00001 (Accession XM_088525) is another VGAM178 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00001, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39774, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11945] Another function of VGAM178 is therefore inhibition of FLJ00001 (Accession XM_088525). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. FLJ12076 (Accession NM_025187) is another VGAM178 host target gene. FLJ12076 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12076 BINDING SITE, designated SEQ ID:24823, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11946] Another function of VGAM178 is therefore inhibition of FLJ12076 (Accession NM_025187). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ12076. FLJ12363 (Accession NM_032167) is another VGAM178 host target gene. FLJ12363 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12363 BINDING SITE, designated SEQ ID:25865, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11947] Another function of VGAM178 is therefore inhibition of FLJ12363 (Accession NM_032167). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12363. FLJ13441 (Accession NM_023924) is another VGAM178 host target gene. FLJ13441 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13441 BINDING SITE, designated SEQ ID:23391, to the nucleotide sequence of

VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11948] Another function of VGAM178 is therefore inhibition of FLJ13441 (Accession NM_023924). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13441. FLJ14594 (Accession NM_032808) is another VGAM178 host target gene. FLJ14594 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14594 BINDING SITE, designated SEQ ID:26565, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11949] Another function of VGAM178 is therefore inhibition of FLJ14594 (Accession NM_032808). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14594. FLJ20898 (Accession NM_024600) is another VGAM178 host target gene. FLJ20898 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ20898, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20898 BINDING SITE, designated SEQ ID:23850, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11950] Another function of VGAM178 is therefore inhibition of FLJ20898 (Accession NM_024600). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20898. FLJ21603 (Accession NM_024762) is another VGAM178 host target gene. FLJ21603 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21603, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21603 BINDING SITE, designated SEQ ID:24118, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11951] Another function of VGAM178 is therefore inhibition of FLJ21603 (Accession NM_024762). Accordingly, utilities of

VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21603. FLJ22938 (Accession NM_024676) is another VGAM178 host target gene. FLJ22938 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22938 BINDING SITE, designated SEQ ID:23985, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11952] Another function of VGAM178 is therefore inhibition of FLJ22938 (Accession NM_024676). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22938. GW112 (Accession NM_006418) is another VGAM178 host target gene. GW112 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GW112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GW112 BINDING SITE, designated

SEQ ID:13130, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11953] Another function of VGAM178 is therefore inhibition of GW112 (Accession NM_006418). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GW112. Histamine Receptor H3 (HRH3, Accession NM_007232) is another VGAM178 host target gene. HRH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH3 BINDING SITE, designated SEQ ID:14107, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11954] Another function of VGAM178 is therefore inhibition of Histamine Receptor H3 (HRH3, Accession NM_007232). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH3. KIAA0446 (Accession XM_044155) is another VGAM178 host target gene. KIAA0446 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:34146, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11955] Another function of VGAM178 is therefore inhibition of KIAA0446 (Accession XM_044155). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0446. KIAA0563 (Accession NM_014834) is another VGAM178 host target gene. KIAA0563 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0563 BINDING SITE, designated SEQ ID:16840, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11956] Another function of VGAM178 is therefore inhibition of

KIAA0563 (Accession NM_014834). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0563. KIAA0630 (Accession XM_114729) is another VGAM178 host target gene. KIAA0630 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0630 BINDING SITE, designated SEQ ID:43059, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11957] Another function of VGAM178 is therefore inhibition of KIAA0630 (Accession XM_114729). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0630. KIAA0773 (Accession NM_014690) is another VGAM178 host target gene. KIAA0773 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0773 BINDING SITE, designated SEQ ID:16193, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11958] Another function of VGAM178 is therefore inhibition of KIAA0773 (Accession NM_014690). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0773. KIAA0903 (Accession XM_049251) is another VGAM178 host target gene. KIAA0903 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0903 BINDING SITE, designated SEQ ID:35371, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11959] Another function of VGAM178 is therefore inhibition of KIAA0903 (Accession XM_049251). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0903. KIAA1016 (Accession XM_166260) is another

VGAM178 host target gene. KIAA1016 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1016, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1016 BINDING SITE, designated SEQ ID:44084, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11960] Another function of VGAM178 is therefore inhibition of KIAA1016 (Accession XM_166260). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1016. KIAA1554 (Accession XM_170834) is another VGAM178 host target gene. KIAA1554 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1554, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1554 BINDING SITE, designated SEQ ID:45609, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11961] Another function of VGAM178 is therefore inhibition of KIAA1554 (Accession XM_170834). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1554. KIAA1582 (Accession XM_037262) is another VGAM178 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32584, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11962] Another function of VGAM178 is therefore inhibition of KIAA1582 (Accession XM_037262). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. KIAA1817 (Accession XM_042978) is another VGAM178 host target gene. KIAA1817 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1817, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1817 BINDING SITE, designated SEQ ID:33861, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11963] Another function of VGAM178 is therefore inhibition of KIAA1817 (Accession XM_042978). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1817. KIAA1853 (Accession XM_045184) is another VGAM178 host target gene. KIAA1853 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1853 BINDING SITE, designated SEQ ID:34383, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11964] Another function of VGAM178 is therefore inhibition of KIAA1853 (Accession XM_045184). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1853. KIAA1940 (Accession XM_086981) is another VGAM178 host target gene. KIAA1940 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1940 BINDING SITE, designated SEQ ID:39004, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11965] Another function of VGAM178 is therefore inhibition of KIAA1940 (Accession XM_086981). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1940. Myristoylated Alanine-rich Protein Kinase C Substrate (MARCKS, Accession NM_002356) is another VGAM178 host target gene. MARCKS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MARCKS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MARCKS BINDING SITE, designated SEQ ID:8166, to the nucleotide

sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11966] Another function of VGAM178 is therefore inhibition of Myristoylated Alanine-rich Protein Kinase C Substrate (MARCKS, Accession NM_002356). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARCKS. MGC15619 (Accession NM_032369) is another VGAM178 host target gene. MGC15619 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15619 BINDING SITE, designated SEQ ID:26158, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11967] Another function of VGAM178 is therefore inhibition of MGC15619 (Accession NM_032369). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15619. MGC20460 (Accession NM_053043) is another VGAM178 host target gene. MGC20460 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC20460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20460 BINDING SITE, designated SEQ ID:27586, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11968] Another function of VGAM178 is therefore inhibition of MGC20460 (Accession NM_053043). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20460. MGC2744 (Accession XM_017557) is another VGAM178 host target gene. MGC2744 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2744, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2744 BINDING SITE, designated SEQ ID:30325, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11969] Another function of VGAM178 is therefore inhibition of

MGC2744 (Accession XM_017557). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2744. MGC3248 (Accession NM_032486) is another VGAM178 host target gene. MGC3248 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3248 BINDING SITE, designated SEQ ID:26237, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11970] Another function of VGAM178 is therefore inhibition of MGC3248 (Accession NM_032486). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3248. NIR3 (Accession XM_038799) is another VGAM178 host target gene. NIR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NIR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of NIR3 BINDING SITE, designated SEQ ID:32926, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11971] Another function of VGAM178 is therefore inhibition of NIR3 (Accession XM_038799). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIR3. Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM_040635) is another VGAM178 host target gene. P2RX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by P2RX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RX1 BINDING SITE, designated SEQ ID:33352, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11972] Another function of VGAM178 is therefore inhibition of Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM_040635). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with P2RX1. Paternally Expressed 10 (PEG10, Accession NM_015068) is another VGAM178 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:17424, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11973] Another function of VGAM178 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM_015068). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM_080792) is another VGAM178 host target gene. PTPNS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTPNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PTPNS1 BINDING SITE, designated SEQ ID:28050, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11974] Another function of VGAM178 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM_080792). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPNS1. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942) is another VGAM178 host target gene. RPS6KA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPS6KA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA4 BINDING SITE, designated SEQ ID:10052, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11975] Another function of VGAM178 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942). Accordingly, utilities of

VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA4. SCAMP-4 (Accession NM_079834) is another VGAM178 host target gene. SCAMP-4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAMP-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAMP-4 BINDING SITE, designated SEQ ID:27819, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11976] Another function of VGAM178 is therefore inhibition of SCAMP-4 (Accession NM_079834). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAMP-4. SCLY (Accession NM_016510) is another VGAM178 host target gene. SCLY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCLY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCLY BINDING SITE, designated SEQ

ID:18589, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11977] Another function of VGAM178 is therefore inhibition of SCLY (Accession NM_016510). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCLY. Septin 3 (SEPT3, Accession NM_019106) is another VGAM178 host target gene. SEPT3 BINDING SITE1 and SEPT3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SEPT3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPT3 BINDING SITE1 and SEPT3 BINDING SITE2, designated SEQ ID:21178 and SEQ ID:21177 respectively, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11978] Another function of VGAM178 is therefore inhibition of Septin 3 (SEPT3, Accession NM_019106). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with SEPT3. Solute Carrier Family 12 (potassium/chloride transporters), Member 8 (SLC12A8, Accession NM_024628) is another VGAM178 host target gene. SLC12A8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC12A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A8 BINDING SITE, designated SEQ ID:23893, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11979] Another function of VGAM178 is therefore inhibition of Solute Carrier Family 12 (potassium/chloride transporters), Member 8 (SLC12A8, Accession NM_024628). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A8. SFRS Protein Kinase 1 (SRPK1, Accession NM_003137) is another VGAM178 host target gene. SRPK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SRPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SRPK1 BINDING SITE, designated SEQ ID:9109, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11980] Another function of VGAM178 is therefore inhibition of SFRS Protein Kinase 1 (SRPK1, Accession NM_003137). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRPK1. Uronyl-2-sulfotransferase (UST, Accession NM_005715) is another VGAM178 host target gene. UST BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UST BINDING SITE, designated SEQ ID:12270, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11981] Another function of VGAM178 is therefore inhibition of Uronyl-2-sulfotransferase (UST, Accession NM_005715). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with UST. VELI1 (Accession NM_004664) is another VGAM178 host target gene. VELI1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by VELI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VELI1 BINDING SITE, designated SEQ ID:11037, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11982] Another function of VGAM178 is therefore inhibition of VELI1 (Accession NM_004664). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VELI1. LOC126823 (Accession XM_059086) is another VGAM178 host target gene. LOC126823 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC126823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126823 BINDING SITE, designated SEQ ID:36863, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA,

also designated SEQ ID:2889.

[11983] Another function of VGAM178 is therefore inhibition of LOC126823 (Accession XM_059086). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126823. LOC129303 (Accession XM_059343) is another VGAM178 host target gene. LOC129303 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC129303, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129303 BINDING SITE, designated SEQ ID:36969, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11984] Another function of VGAM178 is therefore inhibition of LOC129303 (Accession XM_059343). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129303. LOC146108 (Accession XM_085322) is another VGAM178 host target gene. LOC146108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146108, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146108 BINDING SITE, designated SEQ ID:38061, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11985] Another function of VGAM178 is therefore inhibition of LOC146108 (Accession XM_085322). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146108. LOC146237 (Accession XM_096954) is another VGAM178 host target gene. LOC146237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146237 BINDING SITE, designated SEQ ID:40665, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11986] Another function of VGAM178 is therefore inhibition of LOC146237 (Accession XM_096954). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC146237. LOC146745 (Accession XM_085577) is another VGAM178 host target gene. LOC146745 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146745, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146745 BINDING SITE, designated SEQ ID:38231, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11987] Another function of VGAM178 is therefore inhibition of LOC146745 (Accession XM_085577). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146745. LOC147071 (Accession XM_054031) is another VGAM178 host target gene. LOC147071 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147071 BINDING SITE, designated SEQ ID:36134, to

the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11988] Another function of VGAM178 is therefore inhibition of LOC147071 (Accession XM_054031). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147071. LOC147669 (Accession XM_097262) is another VGAM178 host target gene. LOC147669 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147669 BINDING SITE, designated SEQ ID:40853, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11989] Another function of VGAM178 is therefore inhibition of LOC147669 (Accession XM_097262). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147669. LOC148255 (Accession XM_086120) is another VGAM178 host target gene. LOC148255 BINDING SITE1 and LOC148255 BINDING SITE2 are HOST TARGET

binding sites found in untranslated regions of mRNA encoded by LOC148255, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148255 BINDING SITE1 and LOC148255 BINDING SITE2, designated SEQ ID:38498 and SEQ ID:38499 respectively, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11990] Another function of VGAM178 is therefore inhibition of LOC148255 (Accession XM_086120). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148255. LOC148946 (Accession XM_097557) is another VGAM178 host target gene. LOC148946 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148946 BINDING SITE, designated SEQ ID:40936, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11991] Another function of VGAM178 is therefore inhibition of LOC148946 (Accession XM_097557). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148946. LOC149296 (Accession XM_086481) is another VGAM178 host target gene. LOC149296 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149296 BINDING SITE, designated SEQ ID:38693, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11992] Another function of VGAM178 is therefore inhibition of LOC149296 (Accession XM_086481). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149296. LOC151174 (Accession XM_098013) is another VGAM178 host target gene. LOC151174 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151174, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151174 BINDING SITE, designated SEQ ID:41310, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11993] Another function of VGAM178 is therefore inhibition of LOC151174 (Accession XM_098013). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151174. LOC162333 (Accession XM_102591) is another VGAM178 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42126, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11994] Another function of VGAM178 is therefore inhibition of LOC162333 (Accession XM_102591). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC162333. LOC163412 (Accession XM_088868) is another VGAM178 host target gene. LOC163412 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163412, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163412 BINDING SITE, designated SEQ ID:39951, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11995] Another function of VGAM178 is therefore inhibition of LOC163412 (Accession XM_088868). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163412. LOC196027 (Accession XM_113633) is another VGAM178 host target gene. LOC196027 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196027, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196027 BINDING SITE, designated SEQ ID:42304, to the nucleotide sequence of VGAM178 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2889.

[11996] Another function of VGAM178 is therefore inhibition of LOC196027 (Accession XM_113633). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196027. LOC196955 (Accession XM_085210) is another VGAM178 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37926, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11997] Another function of VGAM178 is therefore inhibition of LOC196955 (Accession XM_085210). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC197408 (Accession XM_117031) is another VGAM178 host target gene. LOC197408 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197408, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197408 BINDING SITE, designated SEQ ID:43206, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11998] Another function of VGAM178 is therefore inhibition of LOC197408 (Accession XM_117031). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197408. LOC200251 (Accession XM_114173) is another VGAM178 host target gene. LOC200251 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200251 BINDING SITE, designated SEQ ID:42754, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[11999] Another function of VGAM178 is therefore inhibition of LOC200251 (Accession XM_114173). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC200251. LOC201173 (Accession XM_113312) is another VGAM178 host target gene. LOC201173 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201173 BINDING SITE, designated SEQ ID:42213, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[12000] Another function of VGAM178 is therefore inhibition of LOC201173 (Accession XM_113312). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201173. LOC201220 (Accession XM_113321) is another VGAM178 host target gene. LOC201220 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201220 BINDING SITE, designated SEQ ID:42220, to

the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[12001] Another function of VGAM178 is therefore inhibition of LOC201220 (Accession XM_113321). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201220. LOC201243 (Accession XM_113935) is another VGAM178 host target gene. LOC201243 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201243 BINDING SITE, designated SEQ ID:42553, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[12002] Another function of VGAM178 is therefore inhibition of LOC201243 (Accession XM_113935). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201243. LOC220739 (Accession XM_167548) is another VGAM178 host target gene. LOC220739 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC220739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220739 BINDING SITE, designated SEQ ID:44655, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[12003] Another function of VGAM178 is therefore inhibition of LOC220739 (Accession XM_167548). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220739. LOC253715 (Accession XM_173053) is another VGAM178 host target gene. LOC253715 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253715 BINDING SITE, designated SEQ ID:46310, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[12004] Another function of VGAM178 is therefore inhibition of LOC253715 (Accession XM_173053). Accordingly, utilities

of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253715. LOC255565 (Accession XM_170811) is another VGAM178 host target gene. LOC255565 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255565 BINDING SITE, designated SEQ ID:45590, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[12005] Another function of VGAM178 is therefore inhibition of LOC255565 (Accession XM_170811). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255565. LOC256273 (Accession XM_172847) is another VGAM178 host target gene. LOC256273 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256273 BINDING SITE, designated SEQ ID:46124, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[12006] Another function of VGAM178 is therefore inhibition of LOC256273 (Accession XM_172847). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256273. LOC90525 (Accession XM_032304) is another VGAM178 host target gene. LOC90525 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90525 BINDING SITE, designated SEQ ID:31638, to the nucleotide sequence of VGAM178 RNA, herein designated VGAM RNA, also designated SEQ ID:2889.

[12007] Another function of VGAM178 is therefore inhibition of LOC90525 (Accession XM_032304). Accordingly, utilities of VGAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90525. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 179 (VGAM179) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12008] VGAM179 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM179 was detected is described hereinabove with reference to Figs. 1–8.

[12009] VGAM179 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM179 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12010] VGAM179 gene encodes a VGAM179 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM179 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM179 precursor RNA is designated SEQ ID:165, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:165 is located at position 69393 relative to the genome of

Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12011] VGAM179 precursor RNA folds onto itself, forming VGAM179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12012] An enzyme complex designated DICER COMPLEX, `dices` the VGAM179 folded precursor RNA into VGAM179 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM179 RNA is designated SEQ ID:2890, and is provided hereinbelow with reference to the sequence listing part.

[12013] VGAM179 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM179 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM179 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[12014] VGAM179 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM179 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM179 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM179 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM179 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[12015] The complementary binding of VGAM179 RNA, herein designated VGAM RNA, to host target binding sites on VGAM179 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM179 host target RNA into VGAM179 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12016] It is appreciated that VGAM179 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM179 host target genes. The mRNA of each one of this plurality of VGAM179 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM179 RNA, herein designated VGAM RNA, and which when bound by VGAM179 RNA causes inhibition of translation of respective one or more VGAM179

host target proteins.

[12017] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM179 gene, herein designated VGAM GENE, on one or more VGAM179 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12018] It is yet further appreciated that a function of VGAM179 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syn-

drome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM179 correlate with, and may be deduced from, the identity of the host target genes which VGAM179 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12019] Nucleotide sequences of the VGAM179 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM179 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM179 are further described hereinbelow with reference to Table 1.

[12020] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM179 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM179 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12021] As mentioned hereinabove with reference to Fig. 1, a function of VGAM179 gene, herein designated VGAM is inhibition of expression of VGAM179 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM179 correlate with, and may be deduced from, the identity of the target genes which VGAM179 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12022] Acid Phosphatase 1, Soluble (ACP1, Accession NM_004300) is a VGAM179 host target gene. ACP1 BINDING SITE1 and ACP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ACP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACP1 BINDING SITE1 and ACP1 BINDING SITE2, designated SEQ ID:10509 and SEQ ID:13959 respectively, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12023] A function of VGAM179 is therefore inhibition of Acid Phosphatase 1, Soluble (ACP1, Accession NM_004300), a gene which as demonstrated in starch-gel electrophoresis. Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACP1. The function of ACP1 has

been established by previous studies. Hopkinson et al. (1963) described a new human polymorphism involving erythrocyte acid phosphatase (EC 3.1.3.2) as demonstrated in starch-gel electrophoresis. Three alleles, P(a), P(b) and P(c), are thought to be involved, their frequency being estimated to be 0.35, 0.60 and 0.05, respectively. Another rare allele, P(r), was described by Giblett and Scott (1965). Mohrenweiser and Novotny (1982) described a low activity variant of ACP1 that is frequent (gene frequency of 0.132) in Guaymi Indians of Central America. Data on gene frequencies of allelic variants were tabulated by Roychoudhury and Nei (1988). Red cells of persons with the GUA-1 phenotype had increased basal levels of the flavoenzyme glutathione reductase and a larger fraction of the glutathione reductase protein in the form of the holoenzyme, indicating increased levels of flavin adenine dinucleotide in the red cells of these persons. The finding was consistent with the suggestion that ACP1 has a physiologic function as a flavin mononucleotide phosphatase. This function could regulate the intracellular concentrations of flavin coenzymes and, ultimately, of flavoenzymes, and could be the mechanism for the association between ACP1 type and certain disease states.

Sensabaugh and Golden (1978) showed that ACP1 is inhibited by folic acid and various folates, and that the inhibition is phenotype dependent: ACP1(C) more than ACP1(A) more than ACP1(B). This explains elevation of ACP levels in red cells of patients with megaloblastic anemia and also variation in incidence and severity of favism in G6PD-deficient persons. Swallow et al. (1973) showed that 'red cell' acid phosphatase is not limited to erythrocytes but can be demonstrated in other tissues, including cultured fibroblasts and lymphoblastoid cells where there is no possibility of contamination by blood. Dissing et al. (1991) concluded that 2 electrophoretically distinct isozymes, f and s, which are produced in allele-specific ratios and are associated with each of the 3 major alleles, are generated by alternative splicing of the primary RNA transcript. 2. Junien et al. (1979) assigned the ACP1 locus to 2p25. Larson et al. (1982) studied 4 patients who had inherited an unbalanced form of a familial reciprocal translocation, $t(2;10)(p24;q26)$, giving them partial duplication of 2p. Increased levels of acid phosphatase indicated that ACP1 is located in the 2p24–2pter region and that MDH is not. The previous inconsistency of the SRO (smallest region of overlap) is now resolved; ACP1 is at

2p25. Wo et al. (1992) cloned genes encoding 2 low molecular weight phosphotyrosyl protein phosphatases from a human placenta cDNA library. They were found to have identical nucleotide sequences, with the exception of a 108-bp segment in the middle of the open reading frame. From further studies they concluded that the 2 represent the fast and slow electrophoretic forms of red cell acid phosphatase and that this enzyme is not unique to the red cell but instead is expressed in all human tissues. They examined a human chromosome 2-specific library and demonstrated that the sequences they were studying are located on chromosome 2.

[12024] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12025] Dissing, J.; Johnsen, A. H.; Sensabaugh, G. F. : Human red cell acid phosphatase (ACP1): the amino acid sequence of the two isozymes Bf and Bs encoded by the ACP1*B allele. J. Biol. Chem. 266: 20619–20625, 1991. ; and

[12026] Wo, Y.-Y. P.; McCormack, A. L.; Shabanowitz, J.; Hunt, D. F.; Davis, J. P.; Mitchell, G. L.; Van Etten, R. L. : Sequencing, cloning, and expression of human red cell-type acid phosphata.

[12027] Further studies establishing the function and utilities of ACP1 are found in John Hopkins OMIM database record ID 171500, and in cited publications numbered 11035–11039, 11204, 11234, 11236–11242, 11206, 11243–11248, 3478, 11249–11259, 3780, 1126 and 11261–1853 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Adrenergic, Beta–3–, Receptor (ADRB3, Accession NM_000025) is another VGAM179 host target gene. ADRB3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ADRB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRB3 BINDING SITE, designated SEQ ID:5459, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12028] Another function of VGAM179 is therefore inhibition of Adrenergic, Beta–3–, Receptor (ADRB3, Accession NM_000025), a gene which stimulates adenylyl cyclase activity and regulates lipolysis. Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ADRB3. The function of ADRB3 has been established by previous studies. Emorine et al. (1989) isolated a third beta-adrenergic receptor, beta-3-adrenergic receptor (ADRB3). (See ADRB1 (OMIM Ref. No. 109630) and ADRB2 (OMIM Ref. No. 109690).) Exposure of eukaryotic cells transfected with this gene to adrenaline or noradrenaline promoted the accumulation of adenosine 3-prime,5-prime-monophosphate. The potency of beta-AR agonists and inhibitors was described. Van Spronsen et al. (1993) demonstrated that the transcription-start sites of the mouse and human ADRB3 mRNA are located in a region comprised between 150 and 200 nucleotides 5-prime from the ATG translation-start codon. Motifs potentially implicated in heterologous regulation of ADRB3 expression by glucocorticoids and by beta-adrenergic agonists were identified upstream from these cap sites. Van Spronsen et al. (1993) also described the exon/intron structure of the genes. Their results suggested that utilization of alternate promoters and/or 3-prime untranslated regions may allow tissue-specific regulation of the expression of ADRB3. Wilkie et al. (1993) presented a list of G protein-coupled receptor genes (their Table 3), indi-

cating that the ADRB3 gene had been mapped to 8p12–p11.2 and the homologous gene to mouse chromosome 8. Animal model experiments lend further support to the function of ADRB3. Bachman et al. (2002) created mice that lacked the beta–adrenergic receptors ADRB1, ADRB2, and ADRB3. Beta–less mice on a chow diet had a reduced metabolic rate and were slightly obese. On a high–fat diet, beta–less mice, in contrast to wildtype mice, developed massive obesity that was due entirely to a failure of diet–induced thermogenesis.

[12029] It is appreciated that the abovementioned animal model for ADRB3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[12030] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12033] Further studies establishing the function and utilities of ADRB3 are found in John Hopkins OMIM database record ID 109691, and in cited publications numbered 1446, 4273-4274, 3172, 4275-4284, 4286, 4287-428 and 11892 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATPase, Ca++ Transporting, Cardiac Muscle, Slow Twitch 2 (ATP2A2, Accession NM_001681) is another VGAM179 host target gene. ATP2A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP2A2 BINDING SITE, designated SEQ ID:7401, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12034] Another function of VGAM179 is therefore inhibition of ATPase, Ca++ Transporting, Cardiac Muscle, Slow Twitch 2 (ATP2A2, Accession NM_001681). Accordingly, utilities

of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2A2. Betaine-homocysteine Methyltransferase 2 (BHMT2, Accession NM_017614) is another VGAM179 host target gene. BHMT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BHMT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHMT2 BINDING SITE, designated SEQ ID:19116, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12035] Another function of VGAM179 is therefore inhibition of Betaine-homocysteine Methyltransferase 2 (BHMT2, Accession NM_017614). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHMT2. Breast Cancer 1, Early Onset (BRCA1, Accession NM_007294) is another VGAM179 host target gene. BRCA1 BINDING SITE1 through BRCA1 BINDING SITE10 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BRCA1, corresponding to HOST TARGET binding sites such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRCA1 BINDING SITE1 through BRCA1 BINDING SITE10, designated SEQ ID:14162, SEQ ID:14168, SEQ ID:14174, SEQ ID:14180, SEQ ID:14187, SEQ ID:14193, SEQ ID:14199, SEQ ID:14207, SEQ ID:14213 and SEQ ID:14219 respectively, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12036] Another function of VGAM179 is therefore inhibition of Breast Cancer 1, Early Onset (BRCA1, Accession NM_007294). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRCA1. UDP-N-acetyl-alpha-D-galactosamine:(N-acetylneuraminy)-galactosylglucosylceramide N-acetylgalactosaminyltransferase (GalNAc-T) (GALGT, Accession NM_001478) is another VGAM179 host target gene. GALGT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

GALGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALGT BINDING SITE, designated SEQ ID:7209, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12037] Another function of VGAM179 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:(N-acetylneuraminyl)-galactosylglucosylceramide N-acetylgalactosaminyltransferase (GalNAc-T) (GALGT, Accession NM_001478), a gene which is involved in the biosynthesis of gangliosides gm2, gd2 and ga2. Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALGT. The function of GALGT has been established by previous studies. The G(M2) and G(D2) gangliosides are sialic acid-containing glycosphingolipids involved in signal transduction and cell-cell recognition.

Nagata et al. (1992) used expression cloning to isolate the cDNA encoding the enzyme responsible for generating G(M2) and G(D2) glycosphingolipids. This gene is termed beta-1,4-N-acetylgalactosaminyltransferase (GalNAc-T) (EC 2.4.1.92), or G(M2)/G(D2) synthase. The cDNA encodes a 561-amino acid polypeptide. Northern blot analysis revealed that the gene is expressed as 2 differently sized transcripts in all cells tested that expressed G(MS), G(D2), or both. These findings indicate that the cDNAs catalyze the transfer of GalNAc into G(M3) and G(D3) by a beta-1,4 linkage, resulting in the synthesis of G(M2) and G(D2), respectively. Animal model experiments lend further support to the function of GALGT. Niemann-Pick disease type C (NPC; 267220) is a progressive neurodegenerative disorder caused by mutations in the NPC1 gene and characterized by intracellular accumulation of cholesterol and sphingolipids. To determine the relative contribution of ganglioside accumulation in the neuropathogenesis of Niemann-Pick C disease, Liu et al. (2000) bred NPC model mice with mice carrying a targeted mutation in GalNAc-T. Unlike the NPC model mice, the double mutant mice did not exhibit central nervous system (CNS) accumulation of gangliosides GM2 or of glycolipids GA1 and

GA2. Histologic analysis revealed that the characteristic neuronal storage pathology of NPC disease was substantially reduced in the double mutant mice. By contrast, visceral pathology was similar in the NPC and double mutant mice. Most notably, the clinical phenotype of the double mutant mice, in the absence of CNS ganglioside accumulation and associated neuronal pathology, did not improve. The authors concluded that complex ganglioside storage, while responsible for much of the neuronal pathology, did not significantly influence the clinical phenotype of the NPC model.

[12038] It is appreciated that the abovementioned animal model for GALGT is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[12039] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12040] Liu, Y.; Wu, Y.-P.; Wada, R.; Neufeld, E. B.; Mullin, K. A.; Howard, A. C.; Pentchev, P. G.; Vanier, M. T.; Suzuki, K.; Proia, R. L. : Alleviation of neuronal ganglioside storage does not improve the clinical course of the Niemann–Pick C disease mouse. *Hum. Molec. Genet.* 9: 1087–1092,

2000. ; and

[12041] Nagata, Y.; Yamashiro, S.; Yodoi, J.; Lloyd, K. O.; Shiku, H.; Furukawa, K. : Expression cloning of beta-1,4-N-acetylgalactosaminyltransferase cDNAs that determine the expression of G.

[12042] Further studies establishing the function and utilities of GALGT are found in John Hopkins OMIM database record ID 601873, and in cited publications numbered 1291, 129 and 11383 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hepatic Leukemia Factor (HLF, Accession NM_002126) is another VGAM179 host target gene. HLF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HLF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLF BINDING SITE, designated SEQ ID:7902, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12043] Another function of VGAM179 is therefore inhibition of Hepatic Leukemia Factor (HLF, Accession NM_002126). Accordingly, utilities of VGAM179 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with HLF. Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NM_002430) is another VGAM179 host target gene. MN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MN1 BINDING SITE, designated SEQ ID:8272, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12044] Another function of VGAM179 is therefore inhibition of Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NM_002430). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MN1. Retinoic Acid Receptor, Beta (RARβ, Accession NM_016152) is another VGAM179 host target gene. RARβ BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RARβ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of RARB BINDING SITE, designated SEQ ID:18238, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12045] Another function of VGAM179 is therefore inhibition of Retinoic Acid Receptor, Beta (RARB, Accession NM_016152), a gene which is one member of the steroid/thyroid hormone receptor family of ligand-activated transcription factors. Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RARB. The function of RARB has been established by previous studies. The 3 retinoic acid receptors, alpha (RARA; 180240), beta (RARB), and gamma (RARG; 180190), are members of the nuclear receptor superfamily. Retinoic acid was the first morphogen described in vertebrates. The RARA and RARB genes are more homologous to those of the 2 closely related thyroid hormone receptors THRA and THRB, located on chromosomes 17 and 3, respectively, than to any other members of the nuclear receptor family. These observations suggest that the thyroid hormone and retinoic acid receptors evolved by gene, and possibly chromosome, duplications from a common ancestor which itself di-

verged rather early in evolution from the common ancestor of the steroid receptor group of the family. The RARB gene, formerly symbolized HAP, maps to 3p24 by somatic cell hybridization and in situ hybridization. Benbrook et al. (1988) showed a predominant distribution in epithelial tissues and therefore used the designation RAR(epsilon). By in situ hybridization, Mattei et al. (1988) assigned the RARB gene to 3p24. Using deletion mapping, de The et al. (1990) identified a 27-bp fragment located 59-bp upstream of the transcriptional start, which confers retinoic acid responsiveness on the herpesvirus thymidine kinase promoter. They found indications that both alpha and beta receptors act through the same DNA sequence. Mattei et al. (1991) assigned the corresponding gene to chromosome 14, band A, in the mouse, and to chromosome 15 in the rat. Nadeau et al. (1992) confirmed assignment of the mouse homolog to the centromeric portion of chromosome 14. From a comparison of a hepatitis-B virus (HBV) integration site present in a particular human hepatocellular carcinoma (HCC; 114550) with the corresponding unoccupied site in the nontumorous tissue of the same liver, Dejean et al. (1986) found that HBV integration placed the viral sequence next to a liver cell sequence that

bears a striking resemblance to both an oncogene, ERBA (OMIM Ref. No. 190120), and the supposed DNA-binding domain of the human glucocorticoid receptor (OMIM Ref. No. 138040) and estrogen receptor (OMIM Ref. No. 133430) genes. Dejean et al. (1986) suggested that this gene, usually silent or transcribed at a very low level in normal hepatocytes, becomes inappropriately expressed as a consequence of HBV integration, thus contributing to the cell transformation. By means of a panel of rodent-human somatic cell hybrid DNAs, Dejean et al. (1986) localized the gene to chromosome 3. Further studies by de The et al. (1987) suggested that the HAP gene product may be a novel ligand-responsive regulatory protein whose inappropriate expression in liver is related to hepatocellular carcinogenesis. Brand et al. (1988) showed that the novel protein called HAP (for HBV-activated protein) is a retinoic acid receptor. They referred to this receptor as the beta type (RARβ) and mapped it to 3p25-p21.

[12046] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12047] Benbrook, D.; Lernhardt, E.; Pfahl, M. : A new retinoic acid receptor identified from a hepatocellular carcinoma.

(Letter) Nature 333: 669–672, 1988. ; and

[12048] de The, H.; Marchio, A.; Tiollais, P.; Dejean, A. : A novel steroid thyroid hormone receptor–related gene inappropriately expressed in human hepatocellular carcinoma. Nature 330: 667–670.

[12049] Further studies establishing the function and utilities of RARB are found in John Hopkins OMIM database record ID 180220, and in cited publications numbered 5669–5672, 5709, 5728–573 and 11147–5732 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Reelin (RELN, Accession XM_168628) is another VGAM179 host target gene. RELN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RELN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RELN BINDING SITE, designated SEQ ID:45281, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12050] Another function of VGAM179 is therefore inhibition of Reelin (RELN, Accession XM_168628), a gene which regulates microtubule function in neurons and neuronal mi–

gration. Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RELN. The function of RELN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM35.Spinocerebellar Ataxia 7 (olivopontocerebellar atrophy with retinal degeneration) (SCA7, Accession NM_000333) is another VGAM179 host target gene. SCA7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCA7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCA7 BINDING SITE, designated SEQ ID:5883, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12051] Another function of VGAM179 is therefore inhibition of Spinocerebellar Ataxia 7 (olivopontocerebellar atrophy with retinal degeneration) (SCA7, Accession NM_000333). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCA7. SH3-domain Binding Protein 4

(SH3BP4, Accession NM_014521) is another VGAM179 host target gene. SH3BP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP4 BINDING SITE, designated SEQ ID:15852, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12052] Another function of VGAM179 is therefore inhibition of SH3-domain Binding Protein 4 (SH3BP4, Accession NM_014521), a gene which is of unknown function, contains SH3-domain binding protein 4; similar to the EH-binding protein. Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP4. The function of SH3BP4 has been established by previous studies. A major element of the cornea is a transparent stroma produced and maintained by corneal fibroblasts, or keratocytes. Using differential display of RNA from normal and macular corneal dystrophy cultured keratocytes, followed by screening a corneal fibroblast library, Dunlevy et al.

(1999) identified a cDNA encoding SH3BP4. The deduced 963-amino acid SH3BP4 protein contains 3 asn-pro-phe (NPF) motifs, which are EPS15 (OMIM Ref. No. 600051) homology (EH)-binding sites (see OMIM Ref. No. NUBP1; 603728); an SH3 domain; a PXXP motif; a bipartite nuclear targeting signal; and a tyrosine phosphorylation site. Sequence analysis predicted that SH3BP4 is identical to a 479-amino acid EH-binding protein (Wong et al., 1995) except for the presence of an additional 73 N-terminal and 411 mid- to C-terminal residues in SH3BP4. Northern blot analysis revealed ubiquitous expression of a 5.6-kb transcript, with highest levels in pancreas, low levels in kidney, skeletal muscle, and liver, and lowest levels in lung and brain. Expression was also detected in cultured normal keratocytes. Using FISH, Dunlevy et al. (1999) mapped the SH3BP4 gene to 2q37.1-q37.2.

[12053] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12054] Dunlevy, J. R.; Berryhill, B. L.; Vergnes, J.-P.; SundarRaj, N.; Hassell, J. R. : Cloning, chromosomal localization, and characterization of cDNA from a novel gene, SH3BP4, expressed by human corneal fibroblasts. Genomics 62:

519–524, 1999. ; and

[12055] Wong, W. T.; Schumacher, C.; Salcini, A. E.; Romano, A.; Castagnino, P.; Pelicci, P. G.; DiFiore, P. P. : A protein-binding domain, EH, identified in the receptor tyrosine kinase substrat.

[12056] Further studies establishing the function and utilities of SH3BP4 are found in John Hopkins OMIM database record ID 605611, and in cited publications numbered 6768–6769 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transmembrane Protein 1 (TMEM1, Accession NM_003274) is another VGAM179 host target gene. TMEM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TMEM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMEM1 BINDING SITE, designated SEQ ID:9290, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12057] Another function of VGAM179 is therefore inhibition of Transmembrane Protein 1 (TMEM1, Accession

NM_003274). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEM1. BNIP-S (Accession NM_138278) is another VGAM179 host target gene. BNIP-S BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BNIP-S, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BNIP-S BINDING SITE, designated SEQ ID:28689, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12058] Another function of VGAM179 is therefore inhibition of BNIP-S (Accession NM_138278). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BNIP-S. C1q and Tumor Necrosis Factor Related Protein 6 (C1QTNF6, Accession NM_031910) is another VGAM179 host target gene. C1QTNF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1QTNF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of C1QTNF6 BINDING SITE, designated SEQ ID:25655, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12059] Another function of VGAM179 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 6 (C1QTNF6, Accession NM_031910). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF6. Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM_086728) is another VGAM179 host target gene. C20orf110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf110 BINDING SITE, designated SEQ ID:38836, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12060] Another function of VGAM179 is therefore inhibition of Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM_086728). Accordingly, utilities of VGAM179

include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf110. Choline Kinase (CHK, Accession NM_001277) is another VGAM179 host target gene. CHK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHK BINDING SITE, designated SEQ ID:6944, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12061] Another function of VGAM179 is therefore inhibition of Choline Kinase (CHK, Accession NM_001277). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHK. Cbp/p300-interacting Transactivator, with Glu/Asp-rich Carboxy-terminal Domain, 2 (CITED2, Accession NM_006079) is another VGAM179 host target gene. CITED2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CITED2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CITED2 BINDING SITE, designated SEQ ID:12726, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12062] Another function of VGAM179 is therefore inhibition of Cbp/p300–interacting Transactivator, with Glu/Asp–rich Carboxy–terminal Domain, 2 (CITED2, Accession NM_006079). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CITED2. CTP Synthase II (CTPS2, Accession NM_019857) is another VGAM179 host target gene. CTPS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTPS2 BINDING SITE, designated SEQ ID:21261, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12063] Another function of VGAM179 is therefore inhibition of CTP Synthase II (CTPS2, Accession NM_019857). Accord–

ingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTPS2. FLJ13782 (Accession NM_024915) is another VGAM179 host target gene. FLJ13782 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13782 BINDING SITE, designated SEQ ID:24436, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12064] Another function of VGAM179 is therefore inhibition of FLJ13782 (Accession NM_024915). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13782. JIK (Accession NM_016281) is another VGAM179 host target gene. JIK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JIK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JIK BINDING SITE, designated SEQ ID:18405, to

the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12065] Another function of VGAM179 is therefore inhibition of JIK (Accession NM_016281). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JIK. Potassium Voltage-gated Channel, Shal-related Subfamily, Member 1 (KCND1, Accession NM_004979) is another VGAM179 host target gene. KCND1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCND1 BINDING SITE, designated SEQ ID:11422, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12066] Another function of VGAM179 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily, Member 1 (KCND1, Accession NM_004979). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCND1. KIAA0240 (Accession XM_166479) is another

VGAM179 host target gene. KIAA0240 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0240, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0240 BINDING SITE, designated SEQ ID:44406, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12067] Another function of VGAM179 is therefore inhibition of KIAA0240 (Accession XM_166479). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0240. KIAA0417 (Accession XM_048898) is another VGAM179 host target gene. KIAA0417 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0417 BINDING SITE, designated SEQ ID:35288, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12068] Another function of VGAM179 is therefore inhibition of KIAA0417 (Accession XM_048898). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0417. KIAA1509 (Accession XM_029353) is another VGAM179 host target gene. KIAA1509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1509 BINDING SITE, designated SEQ ID:30875, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12069] Another function of VGAM179 is therefore inhibition of KIAA1509 (Accession XM_029353). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1509. MGC1127 (Accession NM_033549) is another VGAM179 host target gene. MGC1127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC1127, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC1127 BINDING SITE, designated SEQ ID:27308, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12070] Another function of VGAM179 is therefore inhibition of MGC1127 (Accession NM_033549). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1127. SP192 (Accession NM_021639) is another VGAM179 host target gene. SP192 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SP192, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP192 BINDING SITE, designated SEQ ID:22295, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12071] Another function of VGAM179 is therefore inhibition of SP192 (Accession NM_021639). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP192.

Testis-specific Kinase 2 (TESK2, Accession XM_032399) is another VGAM179 host target gene. TESK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TESK2 BINDING SITE, designated SEQ ID:31651, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12072] Another function of VGAM179 is therefore inhibition of Testis-specific Kinase 2 (TESK2, Accession XM_032399). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TESK2. LOC122830 (Accession XM_058661) is another VGAM179 host target gene. LOC122830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122830 BINDING SITE, designated SEQ ID:36705, to the nucleotide sequence of

VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12073] Another function of VGAM179 is therefore inhibition of LOC122830 (Accession XM_058661). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122830. LOC220846 (Accession XM_165515) is another VGAM179 host target gene. LOC220846 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220846, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220846 BINDING SITE, designated SEQ ID:43661, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12074] Another function of VGAM179 is therefore inhibition of LOC220846 (Accession XM_165515). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220846. LOC55580 (Accession NM_017571) is another VGAM179 host target gene. LOC55580 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC55580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC55580 BINDING SITE, designated SEQ ID:18995, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12075] Another function of VGAM179 is therefore inhibition of LOC55580 (Accession NM_017571). Accordingly, utilities of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC55580. LOC91948 (Accession XM_041723) is another VGAM179 host target gene. LOC91948 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91948 BINDING SITE, designated SEQ ID:33573, to the nucleotide sequence of VGAM179 RNA, herein designated VGAM RNA, also designated SEQ ID:2890.

[12076] Another function of VGAM179 is therefore inhibition of LOC91948 (Accession XM_041723). Accordingly, utilities

of VGAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91948. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 180 (VGAM180) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12077] VGAM180 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM180 was detected is described hereinabove with reference to Figs. 1–8.

[12078] VGAM180 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM180 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12079] VGAM180 gene encodes a VGAM180 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM180 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM180 precursor RNA is designated SEQ ID:166, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:166 is located at position 10036 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12080] VGAM180 precursor RNA folds onto itself, forming VGAM180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12081] An enzyme complex designated DICER COMPLEX, `dices` the VGAM180 folded precursor RNA into VGAM180 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM180 RNA is designated SEQ ID:2891, and is provided hereinbelow with reference to the sequence listing part.

[12082] VGAM180 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM180 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM180 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[12083] VGAM180 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM180 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM180 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM180 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM180 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[12084] The complementary binding of VGAM180 RNA, herein designated VGAM RNA, to host target binding sites on VGAM180 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM180 host target RNA into VGAM180 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12085] It is appreciated that VGAM180 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM180 host target genes. The mRNA of each one of this plurality of VGAM180 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM180 RNA, herein designated VGAM RNA, and which when bound by VGAM180 RNA causes inhibition of translation of respective one or more VGAM180 host target proteins.

[12086] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM180 gene, herein designated VGAM GENE, on one or more VGAM180 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12087] It is yet further appreciated that a function of VGAM180 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM180 correlate with, and may be deduced from, the identity of the host target genes which VGAM180 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12088] Nucleotide sequences of the VGAM180 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM180 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM180 are further described hereinbelow with reference to Table 1.

[12089] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM180 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM180 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[12090] As mentioned hereinabove with reference to Fig. 1, a function of VGAM180 gene, herein designated VGAM is inhibition of expression of VGAM180 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM180 correlate with, and may be deduced from, the identity of the target genes which VGAM180 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12091] Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM_056815) is a VGAM180 host target gene. PDE4D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36434, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12092] A function of VGAM180 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession

XM_056815), a gene which has similarity to *Drosophila* dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of PDE4D has been established by previous studies. PDE4D is the mammalian homolog of 'dunce' in *Drosophila*. Flies deficient in this PDE display impairments of the central nervous system and reproductive functions (Dudai et al., 1976). Although only 1 dunce PDE has been described in the fly, 4 orthologous genes are present in mice, rats, and humans: PDE4A (OMIM Ref. No. 600126), PDE4B (OMIM Ref. No. 600127), PDE4C (OMIM Ref. No. 600128), and PDE4D. The encoded proteins share considerable homology in their catalytic and regulatory domains. To examine the role of a PDE in cAMP signaling in vivo, Jin et al. (1999) inactivated the PDE4D gene in mice. This isozyme is involved in feedback regulation of cAMP levels. Mice deficient in PDE4D exhibited delayed growth as well as reduced viability and female fertility. The decrease in fertility of the null female was caused by impaired ovulation and diminished sensitivity of the granulosa cells to gonadotropins. These pleiotropic phenotypes demonstrated

that PDE4D plays a critical role in cAMP signaling and that the activity of this isoenzyme is required for the regulation of growth and fertility. Muscarinic cholinergic signaling plays an essential role in the control of normal airway functions and in the development of pulmonary disease states, including asthma. Hansen et al. (2000) demonstrated that the airways of mice deficient in the cAMP-specific phosphodiesterase PDE4D were no longer responsive to cholinergic stimulation. Airway hyperreactivity that followed exposure to antigen was also abolished in PDE4D $-/-$ mice, despite apparently normal lung inflammatory infiltration. The loss of cholinergic responsiveness was specific to the airway, not observed in the heart, and was associated with a loss of signaling through muscarinic receptors with an inability to decrease cAMP accumulation. These findings demonstrated that the PDE4D gene plays an essential role in cAMP homeostasis and cholinergic stimulation of the airway, and in the development of hyperreactivity. In view of the therapeutic potentials of PDE4 inhibitors, the findings provided the rationale for novel strategies that target a single PDE isoenzyme.

[12093] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[12094] Jin, S.-L. C.; Richard, F. J.; Kuo, W.-P.; D'Ercole, A. J.; Conti, M. : Impaired growth and fertility of cAMP-specific phosphodiesterase PDE4D-deficient mice. Proc. Nat. Acad. Sci. 96: 11998-12003, 1999. ; and

[12095] Hansen, G.; Jin, S.-L. C.; Umetsu, D. T.; Conti, M. : Absence of muscarinic cholinergic airway responses in mice deficient in the cyclic nucleotide phosphodiesterase PDE4D. Proc. Nat. A.

[12096] Further studies establishing the function and utilities of PDE4D are found in John Hopkins OMIM database record ID 600129, and in cited publications numbered 1348-135 and 12445 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Replication Protein A1, 70kDa (RPA1, Accession NM_002945) is another VGAM180 host target gene. RPA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPA1 BINDING SITE, designated SEQ ID:8854, to the nucleotide sequence of VGAM180 RNA, herein designated

VGAM RNA, also designated SEQ ID:2891.

[12097] Another function of VGAM180 is therefore inhibition of Replication Protein A1, 70kDa (RPA1, Accession NM_002945), a gene which is required for simian virus 40 dna replication in vitro. it participates in a very early step in initiation. rp-a is a single-stranded dna-binding protein. Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPA1. The function of RPA1 has been established by previous studies. Replication protein A (RPA) is a 3-subunit single-stranded DNA-binding protein that has been isolated from human cells and found to be essential for in vitro replication of the papovavirus SV40. Erdile et al. (1991) reported the sequence of a cDNA encoding the 70-kD subunit. The human cDNA directed production in E. coli of a 70-kD protein that reacted with a monoclonal antibody directed against the 70-kD subunit of the human protein. The recombinant subunit, purified from bacteria, exhibited single-stranded DNA-binding activity comparable to that of the complete RPA complex. It could substitute for the complete complex in stimulating the activity of DNA polymerase alpha-primase, but could not substitute for the complete complex in SV40 DNA

replication in vitro, suggesting an important functional role for the other subunits. Using PCR amplification of genomic DNA from rodent–human cell lines, Umbricht et al. (1993) mapped the gene for the 70–kD subunit to chromosome 17. By the same method, they mapped the genes for the 32–kD (OMIM Ref. No. 179836) and the 14–kD (OMIM Ref. No. 179837) subunits to chromosomes 1 and 7, respectively. Using a combination of PCR amplification of somatic cell hybrids and radiation hybrids containing chromosome 17 fragments, Umbricht et al. (1994) mapped RPA1 to 17p13.3. Gomes and Wold (1996) constructed a series of N–terminal deletions of RPA70 to explore the function of the protein. Their data indicated that RPA70 is composed of 3 functional domains: an N–terminal domain that is not required for single–stranded DNA binding or SV40 replication, a central DNA–binding domain, and a C–terminal domain that is essential for subunit interactions

[12098] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12099] Umbricht, C. B.; Griffin, C. A.; Hawkins, A. L.; Grzeschik, K. H.; O'Connell, P.; Leach, R.; Green, E. D.; Kelly, T. J. : High–

resolution genomic mapping of the three human replication protein A genes (RPA1, RPA2, and RPA3). Genomics 20: 249–257, 1994. ; and

[12100] Gomes, X. V.; Wold, M. S. : Functional domains of the 70–kilodalton subunit of human replication protein A. Biochemistry 35: 10558–10568, 1996.

[12101] Further studies establishing the function and utilities of RPA1 are found in John Hopkins OMIM database record ID 179835, and in cited publications numbered 1798–1799, 3280–328 and 1800–1802 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Son of Sevenless Homolog 2 (Drosophila) (SOS2, Accession XM_043720) is another VGAM180 host target gene. SOS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOS2 BINDING SITE, designated SEQ ID:34000, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12102] Another function of VGAM180 is therefore inhibition of Son of Sevenless Homolog 2 (Drosophila) (SOS2, Acces–

sion XM_043720). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOS2. TRAM (Accession NM_014294) is another VGAM180 host target gene. TRAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAM BINDING SITE, designated SEQ ID:15593, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12103] Another function of VGAM180 is therefore inhibition of TRAM (Accession NM_014294). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAM. Tripartite Motif-containing 14 (TRIM14, Accession NM_014788) is another VGAM180 host target gene. TRIM14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of TRIM14 BINDING SITE, designated SEQ ID:16668, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12104] Another function of VGAM180 is therefore inhibition of Tripartite Motif-containing 14 (TRIM14, Accession NM_014788), a gene which is composed of 3 zinc-binding domains and is involved in development and cell growth. Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM14. The function of TRIM14 has been established by previous studies. TRIM proteins are composed of 3 zinc-binding domains, a RING, a B-box type 1, and a B-box type 2, followed by a coiled-coil region. They are involved in development and cell growth. By sequencing cDNAs randomly selected from a cDNA library derived from the human immature myeloid cell line KG-1, Nagase et al. (1995) identified a partial cDNA encoding TRIM14, which they called KIAA0129. The deduced 406-amino acid protein is 25% identical to RFP (OMIM Ref. No. 602165). Northern blot analysis revealed wide expression of KIAA0129 that was highest in liver but undetectable in skeletal muscle.

- [12105] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [12106] Nagase, T.; Seki, N.; Tanaka, A.; Ishikawa, K.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. IV. The coding sequences of 40 new genes (KIAA0121–KIAA0160) deduced by analysis of cDNA clones from human cell line KG–1. DNA Res. 2: 167–174, 1995. ; and
- [12107] Reymond, A.; Meroni, G.; Fantozzi, A.; Merla, G.; Cairo, S.; Luzi, L.; Riganelli, D.; Zanaria, E.; Messali, S.; Cainarca, S.; Guffanti, A.; Minucci, S.; Pelicci, P. G.; Ballabio, A. : T.
- [12108] Further studies establishing the function and utilities of TRIM14 are found in John Hopkins OMIM database record ID 606556, and in cited publications numbered 10969 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tripartite Motif–containing 37 (TRIM37, Accession NM_015294) is another VGAM180 host target gene. TRIM37 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen–

tarity of the nucleotide sequences of TRIM37 BINDING SITE, designated SEQ ID:17618, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12109] Another function of VGAM180 is therefore inhibition of Tripartite Motif-containing 37 (TRIM37, Accession NM_015294). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM37. Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Gamma Polypeptide (YWHAG, Accession NM_012479) is another VGAM180 host target gene. YWHAG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YWHAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YWHAG BINDING SITE, designated SEQ ID:14857, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12110] Another function of VGAM180 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan

5-monooxygenase Activation Protein, Gamma Polypeptide (YWHAG, Accession NM_012479), a gene which mediates mitogenic signals of PDGF in vascular smooth muscle cells. Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAG. The function of YWHAG has been established by previous studies. Members of the 14-3-3 protein family play an important role in signal transduction leading to mitosis and cellular proliferation (Morrison, 1994). For background information on 14-3-3 proteins, see 113508. Autieri et al. (1995, 1996) found that rat 14-3-3-gamma (YWHAG) is upregulated in injured rat carotid arteries and that YWHAG mRNA is upregulated in cytokine-stimulated human vascular smooth muscle cells (VSMC). Using PCR primers based on the rat YWHAG sequence to screen human VSMC, Autieri and Carbone (1999) isolated a cDNA encoding YWHAG. The deduced 246-amino acid protein, which shares 98% sequence identity with the rat sequence, has preserved 14-3-3 family signature motifs, a predicted annexin motif, and several potential phosphorylation sites but not the CDK2 (OMIM Ref. No. 116953) phosphorylation motif. By EST database searching, Horie et al. (1999) also obtained

a cDNA encoding YWHAG, which they found to be 100% identical to the 247-amino acid rat sequence. Northern blot analysis revealed ubiquitous expression of a 3.8-kb YWHAG transcript that is relatively strong in brain, skeletal muscle, and heart but weak in peripheral blood leukocytes. By SDS-PAGE and autoradiographic analysis, Autieri and Carbone (1999) found that YWHAG is expressed and phosphorylated by activation with platelet-derived growth factor (OMIM Ref. No. 190040) and other activators of several isoforms of protein kinase C (PKC; e.g., 176960). Inhibitors of PKC block YWHAG phosphorylation. Western blot analysis showed that YWHAG interacts with PKC and with RAF1 (OMIM Ref. No. 164760).

[12111] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12112] Autieri, M. V.; Carbone, C. J. : 14-3-3-Gamma interacts with and is phosphorylated by multiple protein kinase C isoforms in PDGF-stimulated human vascular smooth muscle cells. DNA Cell Biol. 18: 555-564, 1999. ; and

[12113] Horie, M.; Suzuki, M.; Takahashi, E.; Tanigami, A. : Cloning, expression, and chromosomal mapping of the human 14-3-3gamma gene (YWHAG) to 7q11.23. Ge-

nomics 60: 241–243, 1999.

[12114] Further studies establishing the function and utilities of YWHAG are found in John Hopkins OMIM database record ID 605356, and in cited publications numbered 618 and 6629–6632 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Basic Leucine Zipper Nuclear Factor 1 (JEM–1) (BLZF1, Accession NM_003666) is another VGAM180 host target gene. BLZF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BLZF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLZF1 BINDING SITE, designated SEQ ID:9751, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12115] Another function of VGAM180 is therefore inhibition of Basic Leucine Zipper Nuclear Factor 1 (JEM–1) (BLZF1, Accession NM_003666). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLZF1. DKFZP564D172 (Accession NM_032042) is another VGAM180 host target gene. DKFZP564D172 BINDING SITE

is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564D172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D172 BINDING SITE, designated SEQ ID:25752, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12116] Another function of VGAM180 is therefore inhibition of DKFZP564D172 (Accession NM_032042). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D172. FLJ10154 (Accession NM_018011) is another VGAM180 host target gene. FLJ10154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10154 BINDING SITE, designated SEQ ID:19746, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12117] Another function of VGAM180 is therefore inhibition of

FLJ10154 (Accession NM_018011). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10154. FLJ11996 (Accession NM_024976) is another VGAM180 host target gene. FLJ11996 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11996, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11996 BINDING SITE, designated SEQ ID:24533, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12118] Another function of VGAM180 is therefore inhibition of FLJ11996 (Accession NM_024976). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11996. KIAA1432 (Accession XM_039698) is another VGAM180 host target gene. KIAA1432 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA1432 BINDING SITE, designated SEQ ID:33157, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12119] Another function of VGAM180 is therefore inhibition of KIAA1432 (Accession XM_039698). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1432. KIAA1946 (Accession XM_092459) is another VGAM180 host target gene. KIAA1946 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1946 BINDING SITE, designated SEQ ID:40121, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12120] Another function of VGAM180 is therefore inhibition of KIAA1946 (Accession XM_092459). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1946. Spir-1 (Accession XM_035640) is another

VGAM180 host target gene. Spir-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Spir-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Spir-1 BINDING SITE, designated SEQ ID:32308, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12121] Another function of VGAM180 is therefore inhibition of Spir-1 (Accession XM_035640). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Spir-1. Trinucleotide Repeat Containing 6 (TNRC6, Accession XM_047123) is another VGAM180 host target gene. TNRC6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNRC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNRC6 BINDING SITE, designated SEQ ID:34900, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ

ID:2891.

[12122] Another function of VGAM180 is therefore inhibition of Trinucleotide Repeat Containing 6 (TNRC6, Accession XM_047123). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC6. LOC143098 (Accession XM_084421) is another VGAM180 host target gene. LOC143098 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143098, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143098 BINDING SITE, designated SEQ ID:37576, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12123] Another function of VGAM180 is therefore inhibition of LOC143098 (Accession XM_084421). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143098. LOC220883 (Accession XM_166076) is another VGAM180 host target gene. LOC220883 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC220883, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220883 BINDING SITE, designated SEQ ID:43850, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12124] Another function of VGAM180 is therefore inhibition of LOC220883 (Accession XM_166076). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220883. LOC253981 (Accession XM_171064) is another VGAM180 host target gene. LOC253981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253981 BINDING SITE, designated SEQ ID:45867, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12125] Another function of VGAM180 is therefore inhibition of LOC253981 (Accession XM_171064). Accordingly, utilities

of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253981. LOC257464 (Accession XM_116972) is another VGAM180 host target gene. LOC257464 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257464 BINDING SITE, designated SEQ ID:43168, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12126] Another function of VGAM180 is therefore inhibition of LOC257464 (Accession XM_116972). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257464. LOC55885 (Accession NM_018640) is another VGAM180 host target gene. LOC55885 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC55885, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC55885 BINDING SITE, designated SEQ ID:20712, to the nucleotide sequence of VGAM180 RNA, herein designated VGAM RNA, also designated SEQ ID:2891.

[12127] Another function of VGAM180 is therefore inhibition of LOC55885 (Accession NM_018640). Accordingly, utilities of VGAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC55885. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 181 (VGAM181) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12128] VGAM181 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM181 was detected is described hereinabove with reference to Figs. 1–8.

[12129] VGAM181 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM181 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12130] VGAM181 gene encodes a VGAM181 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM181 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM181 precursor RNA is designated SEQ ID:167, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:167 is located at position 284231 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12131] VGAM181 precursor RNA folds onto itself, forming VGAM181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12132] An enzyme complex designated DICER COMPLEX, `dices` the VGAM181 folded precursor RNA into VGAM181 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM181 RNA is designated SEQ ID:2892, and is provided hereinbelow with reference to the sequence listing part.

[12133] VGAM181 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM181 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM181 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12134] VGAM181 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM181 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM181 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM181 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM181 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12135] The complementary binding of VGAM181 RNA, herein designated VGAM RNA, to host target binding sites on VGAM181 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM181 host target RNA into VGAM181 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12136] It is appreciated that VGAM181 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM181 host target genes. The mRNA of each one of this plurality of VGAM181 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM181 RNA, herein designated VGAM RNA, and which when bound by VGAM181 RNA causes inhibition of translation of respective one or more VGAM181 host target proteins.

[12137] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM181 gene, herein designated VGAM GENE, on one or more VGAM181 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12138] It is yet further appreciated that a function of VGAM181 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM181 correlate with, and may be deduced from, the identity of the host target genes which VGAM181 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12139] Nucleotide sequences of the VGAM181 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM181 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM181 are further described hereinbelow with reference to Table 1.

[12140] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM181 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM181 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12141] As mentioned hereinabove with reference to Fig. 1, a function of VGAM181 gene, herein designated VGAM is inhibition of expression of VGAM181 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM181 correlate with, and may be deduced from, the identity of the target genes which VGAM181 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12142] Phosphatidylinositol Glycan, Class C (PIGC, Accession NM_002642) is a VGAM181 host target gene. PIGC BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PIGC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGC BINDING SITE, designated SEQ ID:8502, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM

RNA, also designated SEQ ID:2892.

[12143] A function of VGAM181 is therefore inhibition of Phosphatidylinositol Glycan, Class C (PIGC, Accession NM_002642), a gene which is involved in the first step of gpi biosynthesis. Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGC. The function of PIGC has been established by previous studies. Many eukaryotic membrane proteins are anchored to membranes via glycosylphosphatidylinositol (GPI) anchors. GPI anchoring is a posttranslational modification occurring in the endoplasmic reticulum (ER). The first step of GPI biosynthesis requires at least 3 genes termed PIGA (OMIM Ref. No. 311770), PIGH (OMIM Ref. No. 600154), and PIGC. Inoue et al. (1996) cloned a human homolog of GPI2 and showed that it is PIGC. PIGC encodes a 297-amino acid polypeptide that is 20% identical to yeast GPI2. This gene, when transfected into human cells mutant for PIGC activity, restored proper GPI anchoring. Using immunolocalization, they found human PIGC protein to be present primarily in the ER in transfected cells Using immunoprecipitation experiments, Watanabe et al. (1998) demonstrated that PIGQ (OMIM Ref. No. 605754) associates specifically

with PIGA, PIGC, and PIGH and that all 4 proteins form a complex that has GPI-GlcNAc transferase (GPI-GnT) activity in vitro.

[12144] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12145] Inoue, N.; Watanabe, R.; Takeda, J.; Kinoshita, T. : PIG-C, one of the three human genes involved in the first step of glycosylphosphatidylinositol biosynthesis is a homologue of *Saccharomyces cerevisiae* GPI2. *Biochem. Biophys. Res. Commun.* 226: 193-199, 1996. ; and

[12146] Watanabe, R.; Inoue, N.; Westfall, B.; Taron, C. H.; Orlean, P.; Takeda, J.; Kinoshita, T. : The first step of glycosylphosphatidylinositol biosynthesis is mediated by a complex of PIG-A.

[12147] Further studies establishing the function and utilities of PIGC are found in John Hopkins OMIM database record ID 601730, and in cited publications numbered 930 and 9321 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10408 (Accession NM_018088) is another VGAM181 host target gene. FLJ10408 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded

by FLJ10408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10408 BINDING SITE, designated SEQ ID:19851, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:2892.

[12148] Another function of VGAM181 is therefore inhibition of FLJ10408 (Accession NM_018088). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10408. KIAA0350 (Accession XM_028332) is another VGAM181 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30660, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:2892.

[12149] Another function of VGAM181 is therefore inhibition of KIAA0350 (Accession XM_028332). Accordingly, utilities

of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. KIAA0892 (Accession XM_048457) is another VGAM181 host target gene. KIAA0892 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0892, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0892 BINDING SITE, designated SEQ ID:35174, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:2892.

[12150] Another function of VGAM181 is therefore inhibition of KIAA0892 (Accession XM_048457). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0892. TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256) is another VGAM181 host target gene. TRAF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of TRAF3 BINDING SITE, designated SEQ ID:30039, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:2892.

[12151] Another function of VGAM181 is therefore inhibition of TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF3. LOC150245 (Accession XM_097843) is another VGAM181 host target gene. LOC150245 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150245 BINDING SITE, designated SEQ ID:41159, to the nucleotide sequence of VGAM181 RNA, herein designated VGAM RNA, also designated SEQ ID:2892.

[12152] Another function of VGAM181 is therefore inhibition of LOC150245 (Accession XM_097843). Accordingly, utilities of VGAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC150245. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 182 (VGAM182) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12153] VGAM182 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM182 was detected is described hereinabove with reference to Figs. 1–8.

[12154] VGAM182 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM182 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12155] VGAM182 gene encodes a VGAM182 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM182 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM182 precursor RNA is designated SEQ ID:168, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:168 is located at position 31462 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12156] VGAM182 precursor RNA folds onto itself, forming VGAM182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12157] An enzyme complex designated DICER COMPLEX, `dices` the VGAM182 folded precursor RNA into VGAM182 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM182 RNA is designated SEQ ID:2893, and is provided hereinbelow with reference to the sequence

listing part.

[12158] VGAM182 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM182 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM182 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12159] VGAM182 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM182 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM182 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM182 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM182 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12160] The complementary binding of VGAM182 RNA, herein designated VGAM RNA, to host target binding sites on VGAM182 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM182 host target RNA into VGAM182 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12161] It is appreciated that VGAM182 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM182 host target genes. The mRNA of each one of this plurality of VGAM182 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM182 RNA, herein designated VGAM

RNA, and which when bound by VGAM182 RNA causes inhibition of translation of respective one or more VGAM182 host target proteins.

[12162] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM182 gene, herein designated VGAM GENE, on one or more VGAM182 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12163] It is yet further appreciated that a function of VGAM182 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM182 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM182 correlate with, and may be deduced from, the identity of the host target genes which VGAM182 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12164] Nucleotide sequences of the VGAM182 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM182 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM182 are further described hereinbelow with reference to Table 1.

[12165] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM182 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM182 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12166] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM182 gene, herein designated VGAM is inhibition of expression of VGAM182 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM182 correlate with, and may be deduced from, the identity of the target genes which VGAM182 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12167] Calcium Channel, Voltage-dependent, L Type, Alpha 1C Subunit (CACNA1C, Accession NM_000719) is a VGAM182 host target gene. CACNA1C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CACNA1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNA1C BINDING SITE, designated SEQ ID:6383, to the nucleotide sequence of VGAM182 RNA, herein designated VGAM RNA, also designated SEQ ID:2893.

[12168] A function of VGAM182 is therefore inhibition of Calcium Channel, Voltage-dependent, L Type, Alpha 1C Subunit (CACNA1C, Accession NM_000719), a gene which is alpha-1 subunit of DHP-sensitive calcium channels from cardiac muscle and the brain. Accordingly, utilities of

VGAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA1C. The function of CACNA1C has been established by previous studies. Activation of voltage-sensitive calcium channels by membrane depolarization triggers key cellular responses such as contraction, secretion, excitation, and electrical signaling (Tsien et al., 1991). The L-type currents produced by voltage-sensitive calcium channels are blocked by 1,4-dihydropyridine (DHP) derivatives; thus, the channels responsible for these currents are referred to as DHP-sensitive. The skeletal muscle DHP-sensitive calcium channel is a complex of 5 subunits: alpha-1, alpha-2, beta, gamma, and delta. The DHP-sensitive calcium channels from cardiac muscle and the brain have pharmacologic and electrophysiologic properties that differ from those of the skeletal muscle channel. Powers et al. (1991) isolated a clone for the human CCHL1A1 gene and partially sequenced it. Oligonucleotides based on the human sequence were constructed and used in PCR to amplify specifically this human gene in human-rodent somatic cell hybrids. In this way, the gene was assigned to 12pter-p12. Using a dinucleotide repeat for linkage analysis in the CEPH panel of families, Powers et al. (1992)

narrowed the assignment to 12pter–p13.2. The data placed CACNL1A1 distal to PRB1 (OMIM Ref. No. 180989). By study of somatic cell hybrids, Sun et al. (1992) likewise assigned the CACNL1A1 gene to 12pter–p13. (The gene is also symbolized CACNA1C and CCHL1A1.) Schultz et al. (1993) localized the CCHL1A1 gene to 12p13.3 by study of a 12p somatic cell hybrid mapping panel and by fluorescence in situ hybridization. Animal model experiments lend further support to the function of CACNA1C. Valenzuela et al. (1997) generated knockout mice lacking both forms of Go–alpha (OMIM Ref. No. 139311) by homologous recombination and studied the muscarinic regulation of calcium channels in cardiac muscles in Go–alpha –/– mice and controls. There was no difference in the effect of isoproterenol on the L–type voltage–dependent calcium channel in ventricular myocytes of both groups, but the inhibitory effect of carbamylcholine was almost completely abolished in the Go–alpha –/– group. This demonstrated that, in the heart, Go–alpha is specifically required for transmission of signals from the muscarinic receptor to the L–type voltage–dependent calcium channel.

[12169] It is appreciated that the abovementioned animal model for CACNA1C is acknowledged by those skilled in the art

as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[12170] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12171] Valenzuela, D.; Han, X.; Mende, U.; Fankhauser, C.; Mashimo, H.; Huang, P.; Pfeffer, J.; Neer, E. J.; Fishman, M. C. : G-alpha-o is necessary for muscarinic regulation of Ca(2+) channels in mouse heart. Proc. Nat. Acad. Sci. 94: 1727-2732, 1997. ; and

[12172] Tsien, R. W.; Ellinor, P. T.; Horne, W. A. : Molecular diversity of voltage-dependent Ca(2+) channels. Trends Pharm. Sci. 12: 349-354, 1991.

[12173] Further studies establishing the function and utilities of CACNA1C are found in John Hopkins OMIM database record ID 114205, and in sited publications numbered 179, 10478-4700, 10079-4702, 4850-4849, 361 and 10270 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ11101 (Accession NM_018322) is another VGAM182 host target gene. FLJ11101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11101, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11101 BINDING SITE, designated SEQ ID:20316, to the nucleotide sequence of VGAM182 RNA, herein designated VGAM RNA, also designated SEQ ID:2893.

[12174] Another function of VGAM182 is therefore inhibition of FLJ11101 (Accession NM_018322). Accordingly, utilities of VGAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11101. FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513) is another VGAM182 host target gene. FYCO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FYCO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FYCO1 BINDING SITE, designated SEQ ID:23715, to the nucleotide sequence of VGAM182 RNA, herein designated VGAM RNA, also designated SEQ ID:2893.

[12175] Another function of VGAM182 is therefore inhibition of FYVE and Coiled-coil Domain Containing 1 (FYCO1, Ac-

cession NM_024513). Accordingly, utilities of VGAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FYCO1. Makorin, Ring Finger Protein, 1 (MKRN1, Accession NM_013446) is another VGAM182 host target gene. MKRN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MKRN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKRN1 BINDING SITE, designated SEQ ID:15113, to the nucleotide sequence of VGAM182 RNA, herein designated VGAM RNA, also designated SEQ ID:2893.

[12176] Another function of VGAM182 is therefore inhibition of Makorin, Ring Finger Protein, 1 (MKRN1, Accession NM_013446). Accordingly, utilities of VGAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKRN1. Makorin, Ring Finger Protein, 4 (MKRN4, Accession NM_030757) is another VGAM182 host target gene. MKRN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MKRN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKRN4 BINDING SITE, designated SEQ ID:25042, to the nucleotide sequence of VGAM182 RNA, herein designated VGAM RNA, also designated SEQ ID:2893.

[12177] Another function of VGAM182 is therefore inhibition of Makorin, Ring Finger Protein, 4 (MKRN4, Accession NM_030757). Accordingly, utilities of VGAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKRN4. MTO1 (Accession NM_133645) is another VGAM182 host target gene. MTO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTO1 BINDING SITE, designated SEQ ID:28603, to the nucleotide sequence of VGAM182 RNA, herein designated VGAM RNA, also designated SEQ ID:2893.

[12178] Another function of VGAM182 is therefore inhibition of MTO1 (Accession NM_133645). Accordingly, utilities of VGAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTO1.

Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM_002714) is another VGAM182 host target gene. PPP1R10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R10 BINDING SITE, designated SEQ ID:8574, to the nucleotide sequence of VGAM182 RNA, herein designated VGAM RNA, also designated SEQ ID:2893.

[12179] Another function of VGAM182 is therefore inhibition of Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM_002714). Accordingly, utilities of VGAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R10. STRIN (Accession NM_016271) is another VGAM182 host target gene. STRIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STRIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STRIN BINDING SITE, designated SEQ ID:18398,

to the nucleotide sequence of VGAM182 RNA, herein designated VGAM RNA, also designated SEQ ID:2893.

[12180] Another function of VGAM182 is therefore inhibition of STRIN (Accession NM_016271). Accordingly, utilities of VGAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRIN. Testis-specific Kinase 2 (TESK2, Accession XM_032399) is another VGAM182 host target gene. TESK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TESK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TESK2 BINDING SITE, designated SEQ ID:31650, to the nucleotide sequence of VGAM182 RNA, herein designated VGAM RNA, also designated SEQ ID:2893.

[12181] Another function of VGAM182 is therefore inhibition of Testis-specific Kinase 2 (TESK2, Accession XM_032399). Accordingly, utilities of VGAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TESK2. LOC150481 (Accession XM_086929) is another VGAM182 host target gene. LOC150481 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by LOC150481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150481 BINDING SITE, designated SEQ ID:38983, to the nucleotide sequence of VGAM182 RNA, herein designated VGAM RNA, also designated SEQ ID:2893.

[12182] Another function of VGAM182 is therefore inhibition of LOC150481 (Accession XM_086929). Accordingly, utilities of VGAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150481. LOC158191 (Accession XM_088505) is another VGAM182 host target gene. LOC158191 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158191 BINDING SITE, designated SEQ ID:39759, to the nucleotide sequence of VGAM182 RNA, herein designated VGAM RNA, also designated SEQ ID:2893.

[12183] Another function of VGAM182 is therefore inhibition of

LOC158191 (Accession XM_088505). Accordingly, utilities of VGAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158191. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 183 (VGAM183) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12184] VGAM183 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM183 was detected is described hereinabove with reference to Figs. 1–8.

[12185] VGAM183 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM183 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12186] VGAM183 gene encodes a VGAM183 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM183 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM183 precursor RNA is designated SEQ ID:169, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:169 is located at position 93258 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12187] VGAM183 precursor RNA folds onto itself, forming VGAM183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12188] An enzyme complex designated DICER COMPLEX, `dices` the VGAM183 folded precursor RNA into VGAM183 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 66%) nucleotide sequence of VGAM183 RNA is designated SEQ ID:2894, and is provided hereinbelow with reference to the sequence listing part.

[12189] VGAM183 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM183 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM183 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[12190] VGAM183 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM183 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM183 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM183 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM183 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12191] The complementary binding of VGAM183 RNA, herein designated VGAM RNA, to host target binding sites on VGAM183 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM183 host target RNA into VGAM183 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12192] It is appreciated that VGAM183 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM183 host target genes. The mRNA of each one of this plurality of VGAM183 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM183 RNA, herein designated VGAM RNA, and which when bound by VGAM183 RNA causes inhibition of translation of respective one or more VGAM183 host target proteins.

[12193] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM183 gene, herein designated VGAM GENE, on one or more VGAM183 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12194] It is yet further appreciated that a function of VGAM183 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM183 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM183 correlate with, and may be deduced from, the identity of the host target genes which VGAM183 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12195] Nucleotide sequences of the VGAM183 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM183 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM183 are further described hereinbelow with reference to Table 1.

[12196] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM183 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM183 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[12197] As mentioned hereinabove with reference to Fig. 1, a function of VGAM183 gene, herein designated VGAM is inhibition of expression of VGAM183 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM183 correlate with, and may be deduced from, the identity of the target genes which VGAM183 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12198] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 6 (B4GALT6, Accession XM_008799) is a VGAM183 host target gene. B4GALT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT6 BINDING SITE, designated SEQ ID:30091, to the nucleotide sequence of VGAM183 RNA, herein designated VGAM RNA, also designated SEQ ID:2894.

[12199] A function of VGAM183 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypep-

tide 6 (B4GALT6, Accession XM_008799). Accordingly, utilities of VGAM183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT6. Orthopedia Homolog (Drosophila) (OTP, Accession NM_032109) is another VGAM183 host target gene. OTP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OTP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OTP BINDING SITE, designated SEQ ID:25803, to the nucleotide sequence of VGAM183 RNA, herein designated VGAM RNA, also designated SEQ ID:2894.

[12200] Another function of VGAM183 is therefore inhibition of Orthopedia Homolog (Drosophila) (OTP, Accession NM_032109), a gene which involves in the development of the forebrain and spinal cord. Accordingly, utilities of VGAM183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OTP. The function of OTP has been established by previous studies. Homeodomain genes are helix–turn–helix transcription factors that play key roles in the specification of cell fates. In the central nervous system, homeodomain genes not

only position cells along an axis, but also specify cell migration patterns and may influence axonal connectivity. In an effort to identify novel homeodomain genes involved in the development of the human central nervous system, Lin et al. (1999) cloned, characterized, and mapped the human homolog of the murine homeodomain gene *Orthopedia* (*Otp*), whose product is found in multiple cell groups within the mouse hypothalamus, amygdala, and brain stem. The human OTP cDNA encodes a protein of 325 amino acids. The deduced amino acid sequence is 99% homologous to mouse *Otp* and demonstrated a high degree of conservation when compared to sea urchin and *Drosophila* *Otp* proteins. A single putative OTP gene product was found in 17-week human fetal brain tissue by Western blot analysis using a novel polyclonal antibody raised against a conserved 13-amino acid sequence in the C terminus of the OTP protein. Expression in the developing human hypothalamus was confirmed by immunohistochemistry. Lin et al. (1999) mapped the human OTP gene to chromosome 5q13.3 using analysis of a radiation hybrid panel and by fluorescence in situ hybridization. Animal model experiments lend further support to the function of OTP. Acampora et al. (1999) generated mice defi-

cient in Otp by homologous recombination. Homozygous Otp $-/-$ mice died soon after birth and displayed progressive impairment of crucial neuroendocrine developmental events such as reduced cell proliferation, abnormal cell migration, and failure in terminal differentiation of the parvocellular and magnocellular neurons of the anterior periventricular, paraventricular, supraoptic, and arcuate nuclei. Acampora et al. (1999) suggested that Otp and Sim1 (OMIM Ref. No. 603128) are required to maintain Brn2 (OMIM Ref. No. 600494) expression which, in turn, is required for neuronal cell lineages secreting oxytocin (OMIM Ref. No. 167050), arginine vasopressin (OMIM Ref. No. 192340), and corticotropin-releasing (OMIM Ref. No. 122560) hormones.

[12201] It is appreciated that the abovementioned animal model for OTP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[12202] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Progressive impairment of developing neuroendocrine cell lineages in the hypothalamus of mice lacking the Orthopedia gene. Genes Dev. 13: 2787–2800, 1999. ; and

[12204] Lin, X.; State, M. W.; Vaccarino, F. M.; Greally, J.; Hass, M.; Leckman, J. F. : Identification, chromosomal assignment, and expression analysis of the human homeodomain-containing gene.

[12205] Further studies establishing the function and utilities of OTP are found in John Hopkins OMIM database record ID 604529, and in cited publications numbered 7088–7089 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ20160 (Accession NM_017694) is another VGAM183 host target gene. FLJ20160 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20160 BINDING SITE, designated SEQ ID:19257, to the nucleotide sequence of VGAM183 RNA, herein designated VGAM RNA, also designated SEQ ID:2894.

[12206] Another function of VGAM183 is therefore inhibition of

FLJ20160 (Accession NM_017694). Accordingly, utilities of VGAM183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20160. High-mobility Group (nonhistone chromosomal) Protein 17-like 1 (HMG17L1, Accession NM_021024) is another VGAM183 host target gene. HMG17L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMG17L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMG17L1 BINDING SITE, designated SEQ ID:22015, to the nucleotide sequence of VGAM183 RNA, herein designated VGAM RNA, also designated SEQ ID:2894.

[12207] Another function of VGAM183 is therefore inhibition of High-mobility Group (nonhistone chromosomal) Protein 17-like 1 (HMG17L1, Accession NM_021024). Accordingly, utilities of VGAM183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMG17L1. LOC123283 (Accession XM_071829) is another VGAM183 host target gene. LOC123283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC123283, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123283 BINDING SITE, designated SEQ ID:37423, to the nucleotide sequence of VGAM183 RNA, herein designated VGAM RNA, also designated SEQ ID:2894.

[12208] Another function of VGAM183 is therefore inhibition of LOC123283 (Accession XM_071829). Accordingly, utilities of VGAM183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123283. LOC143524 (Accession XM_084559) is another VGAM183 host target gene. LOC143524 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143524 BINDING SITE, designated SEQ ID:37629, to the nucleotide sequence of VGAM183 RNA, herein designated VGAM RNA, also designated SEQ ID:2894.

[12209] Another function of VGAM183 is therefore inhibition of LOC143524 (Accession XM_084559). Accordingly, utilities of VGAM183 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC143524. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 184 (VGAM184) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12210] VGAM184 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM184 was detected is described hereinabove with reference to Figs. 1–8.

[12211] VGAM184 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM184 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12212] VGAM184 gene encodes a VGAM184 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM184 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM184 precursor RNA is designated SEQ

ID:170, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:170 is located at position 166001 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12213] VGAM184 precursor RNA folds onto itself, forming VGAM184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12214] An enzyme complex designated DICER COMPLEX, `dices` the VGAM184 folded precursor RNA into VGAM184 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM184 RNA is designated SEQ ID:2895, and

is provided hereinbelow with reference to the sequence listing part.

[12215] VGAM184 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM184 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM184 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12216] VGAM184 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM184 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM184 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM184 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM184 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12217] The complementary binding of VGAM184 RNA, herein designated VGAM RNA, to host target binding sites on VGAM184 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM184 host target RNA into VGAM184 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12218] It is appreciated that VGAM184 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM184 host target genes. The mRNA of each one of this plurality of VGAM184 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM184 RNA, herein designated VGAM RNA, and which when bound by VGAM184 RNA causes inhibition of translation of respective one or more VGAM184 host target proteins.

[12219] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM184 gene, herein designated VGAM GENE, on one or more VGAM184 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12220] It is yet further appreciated that a function of VGAM184 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM184 correlate with, and may be deduced from, the identity of the host target genes which VGAM184 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12221] Nucleotide sequences of the VGAM184 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM184 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM184 are further described hereinbelow with reference to Table 1.

[12222] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM184 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM184 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12223] As mentioned hereinabove with reference to Fig. 1, a function of VGAM184 gene, herein designated VGAM is inhibition of expression of VGAM184 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM184 correlate with, and may be deduced from, the identity of the target genes which VGAM184 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12224] D10S170 (Accession NM_005436) is a VGAM184 host target gene. D10S170 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by D10S170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D10S170 BINDING SITE, designated SEQ ID:11917, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:2895.

[12225] A function of VGAM184 is therefore inhibition of D10S170 (Accession NM_005436), a gene which may provide a structural basis for generation of RET/PTC1 rearrangement. Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with D10S170. The function of D10S170 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM142. Dihydropyrimidine Dehydrogenase (DPYD, Accession XM_017469) is another VGAM184 host target gene. DPYD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DPYD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYD BINDING SITE, designated SEQ ID:30315, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:2895.

[12226] Another function of VGAM184 is therefore inhibition of Dihydropyrimidine Dehydrogenase (DPYD, Accession XM_017469). Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYD. V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM_034274) is another VGAM184 host target gene. MYBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

MYBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYBL1 BINDING SITE, designated SEQ ID:32040, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:2895.

[12227] Another function of VGAM184 is therefore inhibition of V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM_034274), a gene which could have a role in the proliferation and/or differentiation of neurogenic, spermatogenic and b-lymphoid cells. Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYBL1. The function of MYBL1 has been established by previous studies. Nomura et al. (1988) isolated and characterized cDNA clones for 2 human MYB-related genes, AMYB and BMYB (OMIM Ref. No. 601415). Using probes in Southern blot analysis of rodent-human hybrid DNAs, Barletta et al. (1991) localized the MYBL1 locus to 8cen-q22 and refined the localization to 8q22-q23 by in situ hybridization. Takahashi et al. (1995) found that MYBL1 mRNA is expressed mainly in testis and peripheral

blood leukocytes. AMYB could activate transcription from the promoter-containing MYB-binding sites in all cells examined. In addition to the 2 domains (a DNA-binding domain and a transcriptional activation domain), 2 negative regulatory domains were identified in the MYBL1 gene.

These results indicated that the gene functions as a transcriptional activator and that the regulatory mechanism of gene activity is similar to that of the MYB (OMIM Ref. No. 189990) gene.

[12228] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12229] Nomura, N.; Takahashi, M.; Matsui, M.; Ishii, S.; Date, T.; Sasamoto, S.; Ishizaki, R. : Isolation of human cDNA clones of MYB-related genes, A-MYB and B-MYB. *Nucleic Acids Res.* 16: 11075-11089, 1988. ; and

[12230] Takahashi, T.; Nakagoshi, H.; Sarai, A.; Nomura, N.; Yamamoto, T.; Ishii, S. : Human A-myb gene encodes a transcriptional activator containing the negative regulatory domains. *FEBS Lett.*

[12231] Further studies establishing the function and utilities of MYBL1 are found in John Hopkins OMIM database record ID 159405, and in cited publications numbered

11008–11010 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ornithine Carbamoyltransferase (OTC, Accession NM_000531) is another VGAM184 host target gene. OTC BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by OTC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OTC BINDING SITE, designated SEQ ID:6132, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:2895.

[12232] Another function of VGAM184 is therefore inhibition of Ornithine Carbamoyltransferase (OTC, Accession NM_000531). Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OTC. CASPR3 (Accession NM_033655) is another VGAM184 host target gene. CASPR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CASPR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CASPR3 BINDING SITE, designated SEQ ID:27387, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:2895.

[12233] Another function of VGAM184 is therefore inhibition of CASPR3 (Accession NM_033655). Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASPR3. KIAA1046 (Accession NM_014928) is another VGAM184 host target gene. KIAA1046 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1046 BINDING SITE, designated SEQ ID:17218, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:2895.

[12234] Another function of VGAM184 is therefore inhibition of KIAA1046 (Accession NM_014928). Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1046. Voltage-dependent Anion Channel 3 (VDAC3,

Accession NM_005662) is another VGAM184 host target gene. VDAC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VDAC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VDAC3 BINDING SITE, designated SEQ ID:12201, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:2895.

[12235] Another function of VGAM184 is therefore inhibition of Voltage-dependent Anion Channel 3 (VDAC3, Accession NM_005662). Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDAC3. LOC143888 (Accession XM_084669) is another VGAM184 host target gene. LOC143888 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143888, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143888 BINDING SITE, designated SEQ ID:37664, to the nucleotide sequence of

VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:2895.

[12236] Another function of VGAM184 is therefore inhibition of LOC143888 (Accession XM_084669). Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143888. LOC149271 (Accession XM_086475) is another VGAM184 host target gene. LOC149271 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149271 BINDING SITE, designated SEQ ID:38672, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:2895.

[12237] Another function of VGAM184 is therefore inhibition of LOC149271 (Accession XM_086475). Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149271. LOC149910 (Accession XM_086699) is another VGAM184 host target gene. LOC149910 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC149910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149910 BINDING SITE, designated SEQ ID:38825, to the nucleotide sequence of VGAM184 RNA, herein designated VGAM RNA, also designated SEQ ID:2895.

[12238] Another function of VGAM184 is therefore inhibition of LOC149910 (Accession XM_086699). Accordingly, utilities of VGAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149910. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 185 (VGAM185) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12239] VGAM185 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM185 was detected is described hereinabove with reference to Figs. 1–8.

[12240] VGAM185 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM185 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12241] VGAM185 gene encodes a VGAM185 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM185 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM185 precursor RNA is designated SEQ ID:171, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:171 is located at position 283443 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12242] VGAM185 precursor RNA folds onto itself, forming VGAM185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[12243] An enzyme complex designated DICER COMPLEX, `dices` the VGAM185 folded precursor RNA into VGAM185 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM185 RNA is designated SEQ ID:2896, and is provided hereinbelow with reference to the sequence listing part.

[12244] VGAM185 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM185 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM185 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12245] VGAM185 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM185 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM185 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM185 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM185 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[12246] The complementary binding of VGAM185 RNA, herein designated VGAM RNA, to host target binding sites on VGAM185 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM185 host target RNA into VGAM185 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12247] It is appreciated that VGAM185 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM185 host target genes. The mRNA of each one of this plurality of VGAM185 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM185 RNA, herein designated VGAM RNA, and which when bound by VGAM185 RNA causes in-

hibition of translation of respective one or more VGAM185 host target proteins.

[12248] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM185 gene, herein designated VGAM GENE, on one or more VGAM185 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12249] It is yet further appreciated that a function of VGAM185 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM185 include diagnosis, prevention and

treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM185 correlate with, and may be deduced from, the identity of the host target genes which VGAM185 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [12250] Nucleotide sequences of the VGAM185 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM185 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM185 are further described hereinbelow with reference to Table 1.
- [12251] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM185 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM185 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [12252] As mentioned hereinabove with reference to Fig. 1, a function of VGAM185 gene, herein designated VGAM is

inhibition of expression of VGAM185 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM185 correlate with, and may be deduced from, the identity of the target genes which VGAM185 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12253] Phospholipase A2, Group IID (PLA2G2D, Accession NM_012400) is a VGAM185 host target gene. PLA2G2D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLA2G2D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G2D BINDING SITE, designated SEQ ID:14770, to the nucleotide sequence of VGAM185 RNA, herein designated VGAM RNA, also designated SEQ ID:2896.

[12254] A function of VGAM185 is therefore inhibition of Phospholipase A2, Group IID (PLA2G2D, Accession NM_012400), a gene which is involved in phospholipid digestion, remodeling of cell membranes, and host defense, as well as pathophysiologic processes. Accordingly, utilities of VGAM185 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with PLA2G2D. The function of PLA2G2D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.DKFZp761D221 (Accession NM_032291) is another VGAM185 host target gene. DKFZp761D221 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761D221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761D221 BINDING SITE, designated SEQ ID:26059, to the nucleotide sequence of VGAM185 RNA, herein designated VGAM RNA, also designated SEQ ID:2896.

[12255] Another function of VGAM185 is therefore inhibition of DKFZp761D221 (Accession NM_032291). Accordingly, utilities of VGAM185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761D221. KIAA0632 (Accession NM_015545) is another VGAM185 host target gene. KIAA0632 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0632, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0632 BINDING SITE, designated SEQ ID:17807, to the nucleotide sequence of VGAM185 RNA, herein designated VGAM RNA, also designated SEQ ID:2896.

[12256] Another function of VGAM185 is therefore inhibition of KIAA0632 (Accession NM_015545). Accordingly, utilities of VGAM185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0632. NDRG Family Member 4 (NDRG4, Accession NM_020465) is another VGAM185 host target gene. NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NDRG4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2, designated SEQ ID:21700 and SEQ ID:23215 respectively, to the nucleotide sequence of VGAM185 RNA, herein designated VGAM RNA, also designated SEQ ID:2896.

[12257] Another function of VGAM185 is therefore inhibition of

NDRG Family Member 4 (NDRG4, Accession NM_020465). Accordingly, utilities of VGAM185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG4. Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 5 (CHST5, Accession NM_012126) is another VGAM186 host target gene. CHST5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST5 BINDING SITE, designated SEQ ID:14441, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12258] Another function of VGAM186 is therefore inhibition of Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 5 (CHST5, Accession NM_012126), a gene which may be involved in sulfation of glycoproteins and proteoglycans. Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST5. The function of CHST5 has been established by previous studies. The carbohydrates of gly-

coconjugates are highly diverse structures with variation in monosaccharide composition, glycosidic linkage positions, and branching of chains. Further diversity is added by the covalent addition of sulfate moieties to particular hydroxyl groups and amino groups of saccharides. The sulfate modifications of glycoproteins can be extensive in amount and frequently occur at high density. They can have a profound effect on the physiochemical properties of the glycoconjugates, at least in part through the addition of negative charge. Carbohydrate sulfation plays a critical role in many biologic processes. The GST family of sulfotransferases includes CHST1 (OMIM Ref. No. 603797), CHST2 (OMIM Ref. No. 603798), CHST3 (OMIM Ref. No. 603799), and LSST. These enzymes are 6-O-sulfotransferases, which add sulfate to C6 of galactose (Gal), N-acetylgalactosamine (OMIM Ref. No. GalNAc), or N-acetylglucosamine (OMIM Ref. No. GlcNAc). By searching an EST database with the sequences of CHST1 and LSST, Lee et al. (1999) identified nonoverlapping ESTs encoding CHST5, which they called IGlcNAc6ST. They isolated additional CHST5 ESTs and assembled a complete CHST5 coding sequence. The deduced 390-amino acid CHST5 protein is predicted to be a type II transmembrane

protein, with an N-terminal cytoplasmic tail of 9 residues and a single transmembrane domain. The extracellular domain contains 3 potential N-glycosylation sites. CHST5 shares 55% amino acid sequence identity with LSST, 35.8% identity with CHST1, and 76% identity with mouse Chst5, whose cDNA Lee et al. (1999) also cloned. Recombinant CHST5 expressed in mammalian cells catalyzed the addition of sulfate to C6 of GlcNAc. Lee et al. (1999) isolated the CHST5 genomic sequence. The CHST5 gene is intronless. Northern blot analysis of a variety of normal human tissues showed a major 2.8-kb CHST5 transcript at relatively high levels in colon and small intestine and at lower levels in fetal liver. Minor transcripts of 3.5, 4, 5, and 8 kb were also found in colon and small intestine. CHST5 expression was not detected in any of the other tissues tested. CHST5, encoding an intestinal sulfotransferase, is situated close to CHST6 (OMIM Ref. No. 605294), which encodes a corneal sulfotransferase and is mutant in cases of macular corneal dystrophy (OMIM Ref. No. 217800). By radiation hybrid analysis, Akama et al. (2000) mapped the CHST5 and CHST6 genes to 16q22, between markers D16S3326 and D16S3016

[12259] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [12260] Akama, T. O.; Nishida, K.; Nakayama, J.; Watanabe, H.; Ozaki, K.; Nakamura, T.; Dota, A.; Kawasaki, S.; Inoue, Y.; Maeda, N.; Yamamoto, S.; Fujiwara, T.; Thonar, E. J.-M. A.; Shimomura, Y.; Kinoshita, S.; Tanigami, A.; Fukuda, M. N. : Macular corneal dystrophy type I and type II are caused by distinct mutations in a new sulphotransferase gene. *Nature Genet.* 26: 237-241, 2000. ; and

- [12262] Further studies establishing the function and utilities of CHST5 are found in John Hopkins OMIM database record ID 604817, and in cited publications numbered 10107 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cytochrome P450, Subfamily IVF, Polypeptide 3 (leukotriene B4 omega hydroxylase) (CYP4F3, Accession NM_000896) is another VGAM186 host target gene. CYP4F3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP4F3, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP4F3 BINDING SITE, designated SEQ ID:6593, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12263] Another function of VGAM186 is therefore inhibition of Cytochrome P450, Subfamily IVF, Polypeptide 3 (leukotriene B4 omega hydroxylase) (CYP4F3, Accession NM_000896), a gene which converts leukotriene B4 into the less active 20-hydroxy-leukotriene B4. Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP4F3. The function of CYP4F3 has been established by previous studies. Leukotrienes are a group of bioactive compounds that play important roles in such processes as inflammation. Kikuta et al. (1993) isolated a cDNA for the human leukotriene B4 omega-hydroxylase (LTB4H), an enzyme which catalyzes the omega-hydroxylation of leukotriene B4. Their cDNA encoded a 520-amino acid protein with a predicted molecular weight of 59,805 Da. The deduced amino acid sequence contains a cysteine in the conserved heme-binding domain near

the C-terminus, which is a characteristic feature of the cytochrome P450 superfamily; the protein shares 31 to 44% similarity with CYP4A, CYP4B (OMIM Ref. No. 124075), and CYP4C. Kikuta et al. (1993) detected transcript from the LTB₄H gene in polymorphonuclear leukocytes and leukocytes.

[12264] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12265] Kikuta, Y.; Kato, M.; Yamashita, Y.; Miyauchi, Y.; Tanaka, K.; Kamada, N.; Kusunose, M. : Human leukotriene B₄ omega-hydroxylase (CYP4F3) gene: molecular cloning and chromosomal localization. DNA Cell Biol. 17: 221-230, 1998. ; and

[12266] Kikuta, Y.; Kusunose, E.; Endo, K.; Yamamoto, S.; Sogawa, K.; Fujii-Kuriyama, Y.; Kusunose, M. : A novel form of cytochrome P-450 family 4 in human polymorphonuclear leukocytes: cDNA cl.

[12267] Further studies establishing the function and utilities of CYP4F3 are found in John Hopkins OMIM database record ID 601270, and in cited publications numbered 9856-9857 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence. Gamma-glutamyl Carboxylase (GGCX, Accession NM_000821) is another VGAM186 host target gene. GGCX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GGCX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGCX BINDING SITE, designated SEQ ID:6483, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12268] Another function of VGAM186 is therefore inhibition of Gamma-glutamyl Carboxylase (GGCX, Accession NM_000821). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGCX. Nuclear Receptor Subfamily 3, Group C, Member 2 (NR3C2, Accession NM_000901) is another VGAM186 host target gene. NR3C2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR3C2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR3C2 BINDING SITE, designated SEQ

ID:6596, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12269] Another function of VGAM186 is therefore inhibition of Nuclear Receptor Subfamily 3, Group C, Member 2 (NR3C2, Accession NM_000901), a gene which is to increase ion and water transport and thus raise extracellular fluid volume and blood pressure and lower potassium levels. Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR3C2. The function of NR3C2 has been established by previous studies. Arriza et al. (1987) used low-stringency hybridization with human glucocorticoid receptor cDNA to isolate a new gene encoding a predicted 107-kD polypeptide. Expression studies demonstrated its ability to bind aldosterone with high affinity and to activate gene transcription in response to aldosterone, thus establishing its identity as the human mineralocorticoid receptor. This molecule also showed high affinity for glucocorticoids. They speculated that, since the circulating level of glucocorticoids is several times higher than those of aldosterone, the primary mineralocorticoid, glucocorticoid activation of the mineralocorti-

coid receptor may be functionally significant. The gene for the estrogen receptor (OMIM Ref. No. 133430) and that for the progesterone receptor (OMIM Ref. No. 607311) have also been cloned. Animal model experiments lend further support to the function of NR3C2. Berger et al. (1998) generated MLR-deficient mice by gene targeting. These mice had a normal prenatal development. During the first week of life, the MLR-deficient mice developed symptoms of pseudohypoaldosteronism. They lost weight and eventually died at approximately 10 days after birth from dehydration by renal sodium and water loss. At day 8, MLR $-/-$ mice showed hyperkalemia, hyponatremia, and a strong increase in renin, angiotensin II, and aldosterone plasma concentrations. The fractional renal Na^+ excretion was elevated more than 8-fold. The glomerular filtration rate in MLR $-/-$ mice was not different from that in controls. The effect of amiloride on renal Na^+ excretion in colonic transepithelial voltage reflected the function of amiloride-sensitive epithelial Na^+ channels.

[12270] It is appreciated that the abovementioned animal model for NR3C2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[12271] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12272] Arriza, J. L.; Weinberger, C.; Cerelli, G.; Glaser, T. M.; Handelin, B. L.; Housman, D. E.; Evans, R. M. : Cloning of human mineralocorticoid receptor complementary DNA: structural and functional kinship with the glucocorticoid receptor. Science 237: 268–275, 1987. ; and

[12273] Berger, S.; Bleich, M.; Schmid, W.; Cole, T. J.; Peters, J.; Watanabe, H.; Kriz, W.; Warth, R.; Greger, R.; Schutz, G. : Mineralocorticoid receptor knockout mice: pathophysiology of Na⁺.

[12274] Further studies establishing the function and utilities of NR3C2 are found in John Hopkins OMIM database record ID 600983, and in cited publications numbered 7886–7887, 8592–789 and 5457–5458 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chemokine (C–C motif) Receptor 6 (CCR6, Accession NM_004367) is another VGAM186 host target gene. CCR6 BINDING SITE1 and CCR6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CCR6, corresponding to HOST TARGET binding sites such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR6 BINDING SITE1 and CCR6 BINDING SITE2, designated SEQ ID:10578 and SEQ ID:25372 respectively, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12275] Another function of VGAM186 is therefore inhibition of Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM_004367). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR6. FLJ10656 (Accession NM_018170) is another VGAM186 host target gene. FLJ10656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10656 BINDING SITE, designated SEQ ID:19989, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12276] Another function of VGAM186 is therefore inhibition of FLJ10656 (Accession NM_018170). Accordingly, utilities of

VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10656. FLJ10751 (Accession NM_018205) is another VGAM186 host target gene. FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10751, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2, designated SEQ ID:20097 and SEQ ID:20196 respectively, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12277] Another function of VGAM186 is therefore inhibition of FLJ10751 (Accession NM_018205). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10751. FLJ12363 (Accession NM_032167) is another VGAM186 host target gene. FLJ12363 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ12363 BINDING SITE, designated SEQ ID:25871, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12278] Another function of VGAM186 is therefore inhibition of FLJ12363 (Accession NM_032167). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12363. FLJ22054 (Accession XM_170478) is another VGAM186 host target gene. FLJ22054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22054 BINDING SITE, designated SEQ ID:45319, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12279] Another function of VGAM186 is therefore inhibition of FLJ22054 (Accession XM_170478). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22054. FLJ22167 (Accession NM_024533) is another VGAM186

host target gene. FLJ22167 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22167, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22167 BINDING SITE, designated SEQ ID:23743, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12280] Another function of VGAM186 is therefore inhibition of FLJ22167 (Accession NM_024533). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22167. FLJ31455 (Accession NM_144964) is another VGAM186 host target gene. FLJ31455 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31455, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31455 BINDING SITE, designated SEQ ID:29580, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12281] Another function of VGAM186 is therefore inhibition of FLJ31455 (Accession NM_144964). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31455. HSA249128 (Accession NM_017583) is another VGAM186 host target gene. HSA249128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA249128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA249128 BINDING SITE, designated SEQ ID:19026, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12282] Another function of VGAM186 is therefore inhibition of HSA249128 (Accession NM_017583). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA249128. KIAA0408 (Accession NM_014702) is another VGAM186 host target gene. KIAA0408 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0408, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0408 BINDING SITE, designated SEQ ID:16235, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12283] Another function of VGAM186 is therefore inhibition of KIAA0408 (Accession NM_014702). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0408. KIAA0798 (Accession NM_014650) is another VGAM186 host target gene. KIAA0798 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0798 BINDING SITE, designated SEQ ID:16071, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12284] Another function of VGAM186 is therefore inhibition of KIAA0798 (Accession NM_014650). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0798. KIAA1950 (Accession XM_166532) is another VGAM186 host target gene. KIAA1950 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1950 BINDING SITE, designated SEQ ID:44494, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12285] Another function of VGAM186 is therefore inhibition of KIAA1950 (Accession XM_166532). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950. MGC11352 (Accession XM_035941) is another VGAM186 host target gene. MGC11352 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11352 BINDING SITE, designated SEQ ID:32357, to the nucleotide sequence of VGAM186 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2897.

[12286] Another function of VGAM186 is therefore inhibition of MGC11352 (Accession XM_035941). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11352. MRPL56 (Accession NM_032857) is another VGAM186 host target gene. MRPL56 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL56 BINDING SITE, designated SEQ ID:26659, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12287] Another function of VGAM186 is therefore inhibition of MRPL56 (Accession NM_032857). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL56. Netrin 4 (NTN4, Accession XM_031896) is another VGAM186 host target gene. NTN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NTN4, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTN4 BINDING SITE, designated SEQ ID:31516, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12288] Another function of VGAM186 is therefore inhibition of Netrin 4 (NTN4, Accession XM_031896). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTN4. Ring Finger Protein 11 (RNF11, Accession NM_014372) is another VGAM186 host target gene. RNF11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF11 BINDING SITE, designated SEQ ID:15707, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12289] Another function of VGAM186 is therefore inhibition of Ring Finger Protein 11 (RNF11, Accession NM_014372).

Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF11. LOC116071 (Accession NM_138456) is another VGAM186 host target gene. LOC116071 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116071 BINDING SITE, designated SEQ ID:28816, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12290] Another function of VGAM186 is therefore inhibition of LOC116071 (Accession NM_138456). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116071. LOC159036 (Accession XM_099018) is another VGAM186 host target gene. LOC159036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC159036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC159036 BINDING SITE, designated SEQ ID:42055, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12291] Another function of VGAM186 is therefore inhibition of LOC159036 (Accession XM_099018). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159036. LOC196540 (Accession XM_116933) is another VGAM186 host target gene. LOC196540 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196540 BINDING SITE, designated SEQ ID:43152, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12292] Another function of VGAM186 is therefore inhibition of LOC196540 (Accession XM_116933). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196540. LOC220662 (Accession XM_165978) is an-

other VGAM186 host target gene. LOC220662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220662 BINDING SITE, designated SEQ ID:43826, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12293] Another function of VGAM186 is therefore inhibition of LOC220662 (Accession XM_165978). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220662. LOC221178 (Accession XM_167936) is another VGAM186 host target gene. LOC221178 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221178 BINDING SITE, designated SEQ ID:44929, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12294] Another function of VGAM186 is therefore inhibition of LOC221178 (Accession XM_167936). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221178. LOC221490 (Accession XM_168084) is another VGAM186 host target gene. LOC221490 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221490, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221490 BINDING SITE, designated SEQ ID:44986, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12295] Another function of VGAM186 is therefore inhibition of LOC221490 (Accession XM_168084). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221490. LOC254100 (Accession XM_172851) is another VGAM186 host target gene. LOC254100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254100, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254100 BINDING SITE, designated SEQ ID:46130, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12296] Another function of VGAM186 is therefore inhibition of LOC254100 (Accession XM_172851). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254100. LOC255328 (Accession XM_172920) is another VGAM186 host target gene. LOC255328 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255328 BINDING SITE, designated SEQ ID:46181, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12297] Another function of VGAM186 is therefore inhibition of LOC255328 (Accession XM_172920). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC255328. LOC90072 (Accession XM_028702) is another VGAM186 host target gene. LOC90072 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90072 BINDING SITE, designated SEQ ID:30730, to the nucleotide sequence of VGAM186 RNA, herein designated VGAM RNA, also designated SEQ ID:2897.

[12298] Another function of VGAM186 is therefore inhibition of LOC90072 (Accession XM_028702). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90072. LOC92267 (Accession XM_043979) is another VGAM186 host target gene. LOC92267 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92267 BINDING SITE, designated SEQ ID:34060, to the nucleotide sequence of VGAM186 RNA, herein designated

VGAM RNA, also designated SEQ ID:2897.

[12299] Another function of VGAM186 is therefore inhibition of LOC92267 (Accession XM_043979). Accordingly, utilities of VGAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92267. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 187 (VGAM187) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12300] VGAM187 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM187 was detected is described hereinabove with reference to Figs. 1–8.

[12301] VGAM187 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM187 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12302] VGAM187 gene encodes a VGAM187 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM187 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM187 precursor RNA is designated SEQ ID:173, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:173 is located at position 290507 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12303] VGAM187 precursor RNA folds onto itself, forming VGAM187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12304] An enzyme complex designated DICER COMPLEX, `dices` the VGAM187 folded precursor RNA into VGAM187 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM187 RNA is designated SEQ ID:2898, and is provided hereinbelow with reference to the sequence listing part.

[12305] VGAM187 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM187 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM187 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12306] VGAM187 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM187 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM187 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM187 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM187 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12307] The complementary binding of VGAM187 RNA, herein designated VGAM RNA, to host target binding sites on VGAM187 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM187 host target RNA into VGAM187 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12308] It is appreciated that VGAM187 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM187 host target genes. The mRNA of each one of this plurality of VGAM187 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM187 RNA, herein designated VGAM RNA, and which when bound by VGAM187 RNA causes inhibition of translation of respective one or more VGAM187 host target proteins.

[12309] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM187 gene, herein designated VGAM GENE, on one or more VGAM187 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[12310] It is yet further appreciated that a function of VGAM187 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM187 correlate with, and may be deduced from, the identity of the host target genes which VGAM187 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12311] Nucleotide sequences of the VGAM187 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM187 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM187 are further described hereinbelow with reference to Table 1.

[12312] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM187 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM187 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12313] As mentioned hereinabove with reference to Fig. 1, a function of VGAM187 gene, herein designated VGAM is inhibition of expression of VGAM187 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM187 correlate with, and may be deduced from, the identity of the target genes which VGAM187 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12314] Ankyrin 1, Erythrocytic (ANK1, Accession NM_000037) is a VGAM187 host target gene. ANK1 BINDING SITE1 through ANK1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE1 through ANK1 BINDING SITE3, designated SEQ ID:5475, SEQ ID:21728 and SEQ ID:30278 respectively, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2898.

[12315] A function of VGAM187 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession NM_000037). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 2 (GalNAc-T2) (GALNT2, Accession NM_004481) is another VGAM187 host target gene. GALNT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT2 BINDING SITE, designated SEQ ID:10800, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:2898.

[12316] Another function of VGAM187 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 2 (GalNAc-T2) (GALNT2, Accession NM_004481), a gene which catalyzes the initial reaction in o-linked oligosaccharide biosynthesis. Accord-

ingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT2. The function of GALNT2 has been established by previous studies. UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase (GalNAc-T; EC 2.4.1.41) transfers an N-acetyl galactosamine (OMIM Ref. No. GalNAc) to the hydroxyl group of a serine or threonine residue in the first step of O-linked oligosaccharide biosynthesis. White et al. (1995) purified GALNT2, termed GalNAc-T2 by them, from human placenta, using a defined synthetic acceptor peptide as an affinity ligand. They also identified a cDNA for GALNT2 using polymerase chain reaction with primers derived from the protein sequence of the purified GALNT2. The GALNT2 cDNA encodes a predicted 571-amino acid protein of approximately 64 kD (White et al., 1995). Bennett et al. (1998) found that the GALNT1 (OMIM Ref. No. 602273), GALNT2, and GALNT3 (OMIM Ref. No. 601756) genes contain 11, 16, and 10 exons, respectively. Several intron/exon boundaries are conserved within the 3 genes. By FISH, Bennett et al. (1998) mapped the GALNT2 gene to chromosome 1q41-q42.

[12317] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12318] Bennett, E. P.; Weghuis, D. O.; Merkx, G.; Geurts van Kessel, A.; Eiberg, H.; Clausen, H. : Genomic organization and chromosomal localization of three members of the UDP-N-acetylgalactosamine:polypeptide N-acetylgalactosaminyltransferase family. *Glycobiology* 8: 547-555, 1998. ; and

[12319] White, T.; Bennett, E. P.; Takio, K.; Sorensen, T.; Bonding, N.; Clausen, H. : Purification and cDNA cloning of a human UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosam.

[12320] Further studies establishing the function and utilities of GALNT2 are found in John Hopkins OMIM database record ID 602274, and in cited publications numbered 2824 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ubiquitin Protein Ligase E3A (human papilloma virus E6-associated protein, Angelman syndrome) (UBE3A, Accession NM_130838) is another VGAM187 host target gene. UBE3A BINDING SITE1 through UBE3A BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

UBE3A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE3A BINDING SITE1 through UBE3A BINDING SITE3, designated SEQ ID:28361, SEQ ID:28365 and SEQ ID:6080 respectively, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:2898.

[12321] Another function of VGAM187 is therefore inhibition of Ubiquitin Protein Ligase E3A (human papilloma virus E6-associated protein, Angelman syndrome) (UBE3A, Accession NM_130838). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3A. Paraneoplastic Antigen MA1 (PNMA1, Accession NM_006029) is another VGAM187 host target gene. PNMA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PNMA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNMA1 BINDING SITE, designated SEQ ID:12645, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA,

also designated SEQ ID:2898.

[12322] Another function of VGAM187 is therefore inhibition of Paraneoplastic Antigen MA1 (PNMA1, Accession NM_006029). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNMA1. Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958) is another VGAM187 host target gene. RNF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF8 BINDING SITE, designated SEQ ID:10093, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:2898.

[12323] Another function of VGAM187 is therefore inhibition of Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF8. LOC256642 (Accession XM_172797) is another VGAM187 host target gene. LOC256642 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by LOC256642, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256642 BINDING SITE, designated SEQ ID:46079, to the nucleotide sequence of VGAM187 RNA, herein designated VGAM RNA, also designated SEQ ID:2898.

[12324] Another function of VGAM187 is therefore inhibition of LOC256642 (Accession XM_172797). Accordingly, utilities of VGAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256642. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 188 (VGAM188) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12325] VGAM188 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM188 was detected is described hereinabove with reference to Figs. 1-8.

[12326] VGAM188 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM188 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12327] VGAM188 gene encodes a VGAM188 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM188 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM188 precursor RNA is designated SEQ ID:174, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:174 is located at position 52782 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12328] VGAM188 precursor RNA folds onto itself, forming VGAM188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12329] An enzyme complex designated DICER COMPLEX, `dices` the VGAM188 folded precursor RNA into VGAM188 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM188 RNA is designated SEQ ID:2899, and is provided hereinbelow with reference to the sequence listing part.

[12330] VGAM188 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM188 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM188 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12331] VGAM188 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM188 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM188 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM188 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM188 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12332] The complementary binding of VGAM188 RNA, herein designated VGAM RNA, to host target binding sites on VGAM188 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM188 host target RNA into VGAM188 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12333] It is appreciated that VGAM188 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM188 host target genes. The mRNA of each one of this plurality of VGAM188 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM188 RNA, herein designated VGAM RNA, and which when bound by VGAM188 RNA causes inhibition of translation of respective one or more VGAM188 host target proteins.

[12334] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM188 gene, herein designated VGAM GENE, on one or more VGAM188 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12335] It is yet further appreciated that a function of VGAM188 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM188 correlate with, and may be deduced from, the identity of the host target genes which VGAM188 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12336] Nucleotide sequences of the VGAM188 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM188 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM188 are further described hereinbelow with reference to Table 1.

[12337] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM188 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM188 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12338] As mentioned hereinabove with reference to Fig. 1, a function of VGAM188 gene, herein designated VGAM is inhibition of expression of VGAM188 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM188 correlate with, and may be deduced from, the identity of the target genes which VGAM188 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12339] V-akt Murine Thymoma Viral Oncogene Homolog 1 (AKT1, Accession NM_005163) is a VGAM188 host target gene. AKT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AKT1,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKT1 BINDING SITE, designated SEQ ID:11652, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:2899.

[12340] A function of VGAM188 is therefore inhibition of V-akt Murine Thymoma Viral Oncogene Homolog 1 (AKT1, Accession NM_005163), a gene which Serine-threonine protein kinase. Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKT1. The function of AKT1 has been established by previous studies. Phosphoinositide 3-kinases, or PI3Ks (see OMIM Ref. No. PIK3CA; 171834), generate specific inositol lipids implicated in the regulation of cell growth, proliferation, survival, differentiation, and cytoskeletal changes. One of the best characterized targets of PI3K lipid products is the protein kinase AKT, or protein kinase B (PKB). In quiescent cells, PKB resides in the cytosol in a low-activity conformation. Upon cellular stimulation, PKB is activated through recruitment to cellular membranes by PI3K lipid products and by phosphorylation by 3-prime phosphoinositide-dependent

kinase-1 (PDPK1; 605213). For a review of the mechanism that activates PKB and the downstream actions of this multifunctional kinase, see Vanhaesebroeck and Alessi (2000). For a review of the possible role of PKB in glucose transport, see Hajdуч et al. (2001). Animal model experiments lend further support to the function of AKT1. Holland et al. (2000) transferred, in a tissue-specific manner, genes encoding activated forms of Ras (OMIM Ref. No. 190070) and Akt to astrocytes and neural progenitors in mice. Holland et al. (2000) found that although neither activated Ras nor Akt alone was sufficient to induce glioblastoma multiforme (GBM; 137800) formation, the combination of activated Ras and Akt induced high-grade gliomas with the histologic features of human GBMs. These tumors appeared to arise after gene transfer to neural progenitors, but not after transfer to differentiated astrocytes. Increased activity of RAS is found in many human GBMs, and Holland et al. (2000) demonstrated that Akt activity is increased in most of these tumors, implying that combined activation of these 2 pathways accurately models the biology of this disease. By targeted disruption of the Akt1 gene, Chen et al. (2001) created an Akt1 null mouse model. Homozygous mice were viable but smaller

than wildtype littermates, and they did not display a diabetic phenotype. Upon exposure to genotoxic stress, their life span was shorter. Chen et al. (2001) found that the Akt1 null mice showed increased spontaneous apoptosis in testes and thymi. They observed an attenuation of spermatogenesis in the Akt1 null male mice, and thymocytes were more sensitive to gamma irradiation and dexamethasone-induced apoptosis. Akt1 null mouse embryo fibroblasts were also more susceptible to apoptosis induced by TNF, anti-Fas (OMIM Ref. No. 134637), ultraviolet irradiation, and serum withdrawal.

[12341] It is appreciated that the abovementioned animal model for AKT1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[12342] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12343] Vanhaesebroeck, B.; Alessi, D. R. : The PI3K-PDK1 connection: more than just a road to PKB. *Biochem. J.* 346: 561-576, 2000. ; and

Lett. 492: 199–203, 2001.

[12345] Further studies establishing the function and utilities of AKT1 are found in John Hopkins OMIM database record ID 164730, and in cited publications numbered 11046–11049, 11203, 11215–11217, 11033, 11218–11220, 4713, 11221–11223, 1273 and 12740–11229 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Recombination Activating Gene 1 (RAG1, Accession NM_000448) is another VGAM188 host target gene. RAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAG1 BINDING SITE, designated SEQ ID:6042, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:2899.

[12346] Another function of VGAM188 is therefore inhibition of Recombination Activating Gene 1 (RAG1, Accession NM_000448). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG1. FLJ10856 (Accession

NM_018247) is another VGAM188 host target gene. FLJ10856 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10856 BINDING SITE, designated SEQ ID:20218, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also designated SEQ ID:2899.

[12347] Another function of VGAM188 is therefore inhibition of FLJ10856 (Accession NM_018247). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10856. KIAA0157 (Accession NM_032182) is another VGAM188 host target gene. KIAA0157 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0157 BINDING SITE, designated SEQ ID:25897, to the nucleotide sequence of VGAM188 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2899.

[12348] Another function of VGAM188 is therefore inhibition of KIAA0157 (Accession NM_032182). Accordingly, utilities of VGAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0157. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 189 (VGAM189) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12349] VGAM189 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM189 was detected is described hereinabove with reference to Figs. 1–8.

[12350] VGAM189 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM189 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12351] VGAM189 gene encodes a VGAM189 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM189 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM189 precursor RNA is designated SEQ ID:175, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:175 is located at position 194768 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12352] VGAM189 precursor RNA folds onto itself, forming VGAM189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12353] An enzyme complex designated DICER COMPLEX, `dices` the VGAM189 folded precursor RNA into VGAM189 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM189 RNA is designated SEQ ID:2900, and is provided hereinbelow with reference to the sequence listing part.

[12354] VGAM189 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM189 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM189 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12355] VGAM189 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM189 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM189 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM189 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM189 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12356] The complementary binding of VGAM189 RNA, herein designated VGAM RNA, to host target binding sites on VGAM189 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM189 host target RNA into VGAM189 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12357] It is appreciated that VGAM189 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM189 host target genes. The mRNA of each one of this plurality of VGAM189 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM189 RNA, herein designated VGAM RNA, and which when bound by VGAM189 RNA causes inhibition of translation of respective one or more VGAM189 host target proteins.

[12358] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM189 gene, herein designated VGAM GENE, on one or more VGAM189 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[12359] It is yet further appreciated that a function of VGAM189 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM189 correlate with, and may be deduced from, the identity of the host target genes which VGAM189 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12360] Nucleotide sequences of the VGAM189 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM189 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM189 are further described hereinbelow with reference to Table 1.

[12361] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM189 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM189 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12362] As mentioned hereinabove with reference to Fig. 1, a function of VGAM189 gene, herein designated VGAM is inhibition of expression of VGAM189 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM189 correlate with, and may be deduced from, the identity of the target genes which VGAM189 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12363] Chromosome 14 Open Reading Frame 1 (C14orf1, Accession NM_007176) is a VGAM189 host target gene. C14orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C14orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C14orf1 BINDING SITE, designated SEQ ID:14030, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12364] A function of VGAM189 is therefore inhibition of Chromosome 14 Open Reading Frame 1 (C14orf1, Accession NM_007176). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf1. Early Growth Response 3 (EGR3, Accession XM_005040) is another VGAM189 host target gene. EGR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGR3 BINDING SITE, designated SEQ ID:29959, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12365] Another function of VGAM189 is therefore inhibition of Early Growth Response 3 (EGR3, Accession XM_005040), a gene which is a putative transcription factor. Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR3. The function of EGR3 has been established by previous studies. The human EGR3 gene was described by Patwardhan et al. (1991) as predicting a 387-amino acid

protein containing 3 C2H2 zinc fingers nearly identical to those of EGR1 and EGR2. The EGR3 gene has a single intron. The gene was known to be induced in various brain regions in response to stress or following focal brain injury. Morris et al. (1998) stated that, in the SCN, it probably participates in the transcriptional regulation of genes in response to retinal input, as had been proposed for FOS. Muscle spindles are skeletal muscle sensory organs that provide axial and limb position information (proprioception) to the central nervous system. Spindles consist of encapsulated muscle fibers (intrafusal fibers) that are innervated by specialized motor and sensory axons. Tourtellotte and Milbrandt (1998) found that mice rendered deficient in *Egr3* by gene targeting had gait ataxia, increased frequency of perinatal mortality, scoliosis, resting tremors, and ptosis. Although extrafusal skeletal muscle fibers appeared normal, *Egr3*-deficient animals lacked muscle spindles, a finding that is consistent with their profound gait ataxia. *Egr3* was highly expressed in developing muscle spindles, but not in Ia afferent neurons or their terminals during developmental periods that coincided with the induction of spindle morphogenesis by sensory afferent axons. These results indi-

cated that type I myotubes are dependent upon Egr3-mediated transcription for proper spindle development.

[12366] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12367] Morris, M. E.; Viswanathan, N.; Kuhlman, S.; Davis, F. C.; Weitz, C. J. : A screen for genes induced in the suprachiasmatic nucleus by light. *Science* 279: 1544–1547, 1998.
; and

[12368] Tourtellotte, W. G.; Milbrandt, J. : Sensory ataxia and muscle spindle agenesis in mice lacking the transcription factor Egr3. *Nature Genet.* 20: 87–91, 1998.

[12369] Further studies establishing the function and utilities of EGR3 are found in John Hopkins OMIM database record ID 602419, and in cited publications numbered 1029–1031 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hyaluronoglucosaminidase 4 (HYAL4, Accession NM_012269) is another VGAM189 host target gene. HYAL4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HYAL4, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HYAL4 BINDING SITE, designated SEQ ID:14593, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12370] Another function of VGAM189 is therefore inhibition of Hyaluronoglucosaminidase 4 (HYAL4, Accession NM_012269). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYAL4. Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM_006823) is another VGAM189 host target gene. PKIA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PKIA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKIA BINDING SITE, designated SEQ ID:13695, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12371] Another function of VGAM189 is therefore inhibition of Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha

(PKIA, Accession NM_006823). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKIA. POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM_006235) is another VGAM189 host target gene. POU2AF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POU2AF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU2AF1 BINDING SITE, designated SEQ ID:12889, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12372] Another function of VGAM189 is therefore inhibition of POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM_006235), a gene which is a transcriptional coactivator that specifically associates with either oct1 or oct2. Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU2AF1. The function of POU2AF1 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM171.Telomeric Repeat Binding Factor (NIMA-interacting) 1 (TERF1, Accession NM_017489) is another VGAM189 host target gene. TERF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TERF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TERF1 BINDING SITE, designated SEQ ID:18952, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12373] Another function of VGAM189 is therefore inhibition of Telomeric Repeat Binding Factor (NIMA-interacting) 1 (TERF1, Accession NM_017489), a gene which negatively regulates telomere length, involves in regulation of the mitotic spindle. Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERF1. The function of TERF1 has been established by previous studies. Human chromosomes carry at their termini long arrays of double-stranded hexamers (OMIM Ref. No. TTAGGG) that are maintained by the enzyme telomerase (OMIM Ref. No.

187270). Chong et al. (1995) noted that telomeric DNA is thought to form a protective nucleoprotein cap through its association with telomere-specific proteins; also see review by Zakian (1995). Because the loss of telomere function can induce cell cycle arrest and genome instability, the telomeric complex is probably required in all human cells. Changes in the structure and function of human telomeres are thought to play a role in malignant transformation and cellular senescence. Protein components of the telomeric complex had been identified in ciliates and yeast, but not in vertebrate systems. Quests for vertebrate telomeric proteins had yielded a single candidate that could potentially bind along the length of the telomeric TTAGGG repeat array. This protein, called TRF (telomeric repeat-binding factor) by Chong et al. (1995), was shown by the authors to associate with double-stranded TTAGGG repeat arrays in vitro. TRF displays strong specificity for vertebrate telomere DNA. Human TRF activity is detectable in HeLa cell nuclear extracts on the basis of its ability to alter the mobility of double-stranded DNA fragments containing the sequence (OMIM Ref. No. TTAGGG)¹². Using this assay, Chong et al. (1995) purified HeLa TRF to near homogeneity. Three independent preparations of purified

TRF contained a protein in the 60–kD apparent molecular mass range, which copurified with TRF activity over a column containing double-stranded TTAGGG repeats. Amino acid sequences revealed sequence identity to an anonymous partial cDNA in the GenBank database. On the basis of this nucleotide sequence, cDNAs were isolated from a HeLa cell library, sequenced, and found to contain an open reading frame encoding all sequence peptides. The cDNA hybridized 2 mRNAs of approximately 1.8 and 3.0 kb that are expressed in a variety of human tissues. The cDNA derived from the larger mRNA revealed an open reading frame encoding a 439–amino acid protein. In vitro transcription and translation of the cloned cDNA produced a protein of the same size as purified HeLa TRF. Comparison with the sequence information in the databases indicated that human TRF is a novel protein with 3 previously recognized sequence motifs. There is one DNA-binding repeat resembling that of MYB (OMIM Ref. No. 189990) and an N-terminal acidic domain. Immunofluorescent labeling showed that TRF specifically colocalizes with telomeric DNA in human metaphase cells and is located at chromosome ends during metaphase. Chong et al. (1995) stated that the presence of TRF along the telomeric

TTAGGG repeat array demonstrates that human telomeres form a specialized nuclear protein complex. In yeast, Marcand et al. (1997) demonstrated a protein-counting mechanism for regulation of the length of telomeres. This mechanism involves the telomere repeat-binding protein Rap1p. Because the structural and functional properties of telomeres appear to be highly conserved, Marcand et al. (1997) suggested that their findings may be relevant to telomere length regulation in humans, which has been associated with aging and cancer. Okabe et al. (2000) investigated cellular factors required for telomere formation using the frequency of telomere seeding as an index and identified TRF1 as an essential transacting factor. The exogenous telomere repeat induced telomere formation at a frequency determined by the availability of TRF1, even in telomerase-negative cells. The authors concluded that TRF1 has a novel physiologic significance distinct from its role as a regulator of telomere length in the endogenous chromosome.

[12374] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12375] Chong, L.; van Steensel, B.; Broccoli, D.; Erdjument-Bro-

- mage, H.; Hanish, J.; Tempst, P.; de Lange, T. : A human telomeric protein. *Science* 270: 1663–1667, 1995. ; and
- [12376] Okabe, J.; Eguchi, A.; Masago, A.; Hayakawa, T.; Nakanishi, M. : TRF1 is a critical trans-acting factor required for de novo telomere formation in human cells. *Hum. Molec. Genet.* 9: 263.
- [12377] Further studies establishing the function and utilities of TERF1 are found in John Hopkins OMIM database record ID 600951, and in cited publications numbered 9620–9628 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TIRAP (Accession NM_052887) is another VGAM189 host target gene. TIRAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIRAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIRAP BINDING SITE, designated SEQ ID:27476, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.
- [12378] Another function of VGAM189 is therefore inhibition of TIRAP (Accession NM_052887), a gene which is a adapter involved in the TLR4 signaling pathway in the innate im-

mune response. Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIRAP. The function of TIRAP has been established by previous studies. Different Toll-like receptors (e.g., TLR5, 603031) are part of the innate immune system and recognize pathogen-associated molecular patterns (PAMPs). TLR4 recognizes the lipopolysaccharide of gram-negative bacteria and, like other TLRs, signals through a Toll/IL1R (OMIM Ref. No. 147810) (TIR) domain. MYD88 (OMIM Ref. No. 602170) is an adaptor protein containing a TIR domain and is involved in TLR2 (OMIM Ref. No. 603028), TLR4, TLR5, and TLR9 (OMIM Ref. No. 605474) signaling. By high-throughput sequencing of a dendritic cell EST cDNA library followed by PCR, Fitzgerald et al. (2001) identified a cDNA encoding a MYD88-adaptor-like protein, which they termed MAL. Sequence analysis predicted that the cytoplasmic protein contains a C-terminal TIR domain expected to have a secondary structure similar to that of TLR2 and an N-terminal region lacking a death domain and that is shorter than that of MYD88. Northern blot analysis revealed wide expression of a 2.3-kb transcript, with particularly strong expression in kidney, liver, heart,

and placenta. RT-PCR analysis detected expression in murine dendritic and murine and human monocyte/macrophage cell lines. Using mutational and functional analyses, Horng et al. (2001) determined that TIRAP functions downstream of TLR4, but not IL1R or TLR9.

Lipopolysaccharide or CpG stimulation results in PRKR (OMIM Ref. No. 176871) phosphorylation, indicating that PRKR is a component of both the TLR4 and TLR9 pathways. Immunoprecipitation analysis showed that PRKR, as well as its activator PACT (PRKRA; 603424) and inhibitor p58 (DNAJC3; 601184), are associated with TIRAP. Treatment of a macrophage cell line with an N-terminal mouse Tirap peptide containing the proline-125 region linked to the C terminus of 'antennapedia,' a *Drosophila* transcription factor, potently inhibited lipopolysaccharide-induced, but not CpG-induced or IL1 β -induced, NF κ B or JNK activation, suggesting a potential antiinflammatory molecule. Likewise, the Tirap peptide inhibited CD80 (OMIM Ref. No. 112203) and CD86 (OMIM Ref. No. 601020) upregulation as well as IL12 (OMIM Ref. No. 161560) and IL6 (OMIM Ref. No. 147620) cytokine production in lipopolysaccharide-activated dendritic cells. Horng et al. (2001) concluded that TIRAP functions downstream of TLR4, but not

TLR9, TLR2, or IL1R, and upstream of PRKR, probably in the TLR4/MYD88-independent pathway.

[12379] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12380] Fitzgerald, K. A.; Palsson-McDermott, E. M.; Bowie, A. G.; Jefferies, C. A.; Mansell, A. S.; Brady, G.; Brint, E.; Dunne, A.; Gray, P.; Harte, M. T.; McMurray, D.; Smith, D. E.; Sims, J. E.; Bird, T. A.; O'Neill, L. A. J. : Mal (MyD88-adaptor-like) is required for Toll-like receptor-4 signal transduction. Nature 413: 78-83, 2001. ; and

[12381] Horng, T.; Barton, G. M.; Medzhitov, R. : TIRAP: an adapter molecule in the Toll signaling pathway. Nature Immun. 2: 835-841, 2001.

[12382] Further studies establishing the function and utilities of TIRAP are found in John Hopkins OMIM database record ID 606252, and in cited publications numbered 6137-6138 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Baculoviral IAP Repeat-containing 3 (BIRC3, Accession XM_040715) is another VGAM189 host target gene. BIRC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BIRC3, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC3 BINDING SITE, designated SEQ ID:33370, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12383] Another function of VGAM189 is therefore inhibition of Baculoviral IAP Repeat-containing 3 (BIRC3, Accession XM_040715). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC3. Dynein, Axonemal, Light Polypeptide 4 (DNAL4, Accession NM_005740) is another VGAM189 host target gene. DNAL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAL4 BINDING SITE, designated SEQ ID:12304, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12384] Another function of VGAM189 is therefore inhibition of Dynein, Axonemal, Light Polypeptide 4 (DNAL4, Accession

NM_005740). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAL4. FLJ10656 (Accession NM_018170) is another VGAM189 host target gene. FLJ10656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10656 BINDING SITE, designated SEQ ID:19987, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12385] Another function of VGAM189 is therefore inhibition of FLJ10656 (Accession NM_018170). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10656. FLJ21240 (Accession NM_024847) is another VGAM189 host target gene. FLJ21240 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21240, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ21240 BINDING SITE, designated SEQ ID:24280, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12386] Another function of VGAM189 is therefore inhibition of FLJ21240 (Accession NM_024847). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21240. FLJ21302 (Accession NM_022901) is another VGAM189 host target gene. FLJ21302 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21302 BINDING SITE, designated SEQ ID:23184, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12387] Another function of VGAM189 is therefore inhibition of FLJ21302 (Accession NM_022901). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21302. KIAA0931 (Accession XM_041191) is another VGAM189

host target gene. KIAA0931 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0931 BINDING SITE, designated SEQ ID:33484, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12388] Another function of VGAM189 is therefore inhibition of KIAA0931 (Accession XM_041191). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0931. KIAA1348 (Accession XM_043826) is another VGAM189 host target gene. KIAA1348 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1348, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1348 BINDING SITE, designated SEQ ID:34028, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12389] Another function of VGAM189 is therefore inhibition of KIAA1348 (Accession XM_043826). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1348. Nucleoredoxin (NXN, Accession NM_022463) is another VGAM189 host target gene. NXN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXN BINDING SITE, designated SEQ ID:22804, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12390] Another function of VGAM189 is therefore inhibition of Nucleoredoxin (NXN, Accession NM_022463). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXN. LOC147299 (Accession XM_085763) is another VGAM189 host target gene. LOC147299 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147299, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147299 BINDING SITE, designated SEQ ID:38334, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12391] Another function of VGAM189 is therefore inhibition of LOC147299 (Accession XM_085763). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147299. LOC152627 (Accession XM_087495) is another VGAM189 host target gene. LOC152627 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152627 BINDING SITE, designated SEQ ID:39293, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12392] Another function of VGAM189 is therefore inhibition of LOC152627 (Accession XM_087495). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC152627. LOC221395 (Accession XM_166354) is another VGAM189 host target gene. LOC221395 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221395, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221395 BINDING SITE, designated SEQ ID:44183, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12393] Another function of VGAM189 is therefore inhibition of LOC221395 (Accession XM_166354). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221395. LOC222001 (Accession XM_167489) is another VGAM189 host target gene. LOC222001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222001 BINDING SITE, designated SEQ ID:44640, to the nucleotide sequence of VGAM189 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2900.

[12394] Another function of VGAM189 is therefore inhibition of LOC222001 (Accession XM_167489). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222001. LOC222070 (Accession XM_168433) is another VGAM189 host target gene. LOC222070 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222070 BINDING SITE, designated SEQ ID:45174, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12395] Another function of VGAM189 is therefore inhibition of LOC222070 (Accession XM_168433). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222070. LOC255326 (Accession XM_172832) is another VGAM189 host target gene. LOC255326 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255326, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255326 BINDING SITE, designated SEQ ID:46105, to the nucleotide sequence of VGAM189 RNA, herein designated VGAM RNA, also designated SEQ ID:2900.

[12396] Another function of VGAM189 is therefore inhibition of LOC255326 (Accession XM_172832). Accordingly, utilities of VGAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255326. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 190 (VGAM190) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12397] VGAM190 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM190 was detected is described hereinabove with reference to Figs. 1–8.

[12398] VGAM190 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syn–

drome Virus (white spot bacilliform virus). VGAM190 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12399] VGAM190 gene encodes a VGAM190 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM190 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM190 precursor RNA is designated SEQ ID:176, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:176 is located at position 18488 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12400] VGAM190 precursor RNA folds onto itself, forming VGAM190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12401] An enzyme complex designated DICER COMPLEX, `dices` the VGAM190 folded precursor RNA into VGAM190 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM190 RNA is designated SEQ ID:2901, and is provided hereinbelow with reference to the sequence listing part.

[12402] VGAM190 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM190 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM190 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12403] VGAM190 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM190 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM190 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM190 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM190 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12404] The complementary binding of VGAM190 RNA, herein designated VGAM RNA, to host target binding sites on VGAM190 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM190 host tar-

get RNA into VGAM190 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12405] It is appreciated that VGAM190 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM190 host target genes. The mRNA of each one of this plurality of VGAM190 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM190 RNA, herein designated VGAM RNA, and which when bound by VGAM190 RNA causes inhibition of translation of respective one or more VGAM190 host target proteins.

[12406] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM190 gene, herein designated VGAM GENE, on one or more VGAM190 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12407] It is yet further appreciated that a function of VGAM190 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM190 correlate with, and may be deduced from, the identity of the host target genes which VGAM190 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12408] Nucleotide sequences of the VGAM190 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM190 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM190 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM190 are further described hereinbelow with reference to Table 1.

[12409] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM190 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM190 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12410] As mentioned hereinabove with reference to Fig. 1, a function of VGAM190 gene, herein designated VGAM is inhibition of expression of VGAM190 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM190 correlate with, and may be deduced from, the identity of the target genes which VGAM190 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12411] B-cell CLL/lymphoma 11A (zinc finger protein) (BCL11A, Accession NM_022893) is a VGAM190 host target gene. BCL11A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of BCL11A BINDING SITE, designated SEQ ID:23152, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:2901.

[12412] A function of VGAM190 is therefore inhibition of B-cell CLL/lymphoma 11A (zinc finger protein) (BCL11A, Accession NM_022893), a gene which acts as a transcriptional repressor. Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11A. The function of BCL11A has been established by previous studies. By screening a fetal brain cDNA library with mouse Evi9 as probe, Saiki et al. (2000) isolated a cDNA encoding EVI9, also termed BCL11A, and a shorter splice variant, EVI9C. Sequence analysis predicted that the 797-amino acid BCL11A protein, which is 99% identical to the mouse protein apart from an additional 35 N-terminal residues, contains 3 C2H2-type zinc finger motifs, a proline-rich region, and an acidic domain. Northern blot analysis revealed highest expression in brain, spleen, and testis. RT-PCR analysis detected expression in most hematopoietic cells but downregulation during monocytic differentiation.

Satterwhite et al. (2001) reported the recurrent involvement and deregulated expression of BCL11A in 4 cases of B-cell malignancy with the translocation t(2;14)(p13;q32.3). They noted that this translocation is a rare cytogenetic abnormality in the clinically aggressive subset of B-cell chronic lymphocytic leukemia (OMIM Ref. No. 151400)/immunocytoma. FISH analysis showed colocalization of BCL11A and REL (OMIM Ref. No. 164910) in B-cell non-Hodgkin lymphoma (OMIM Ref. No. 605027). Satterwhite et al. (2001) also identified a BCL11A homolog, BCL11B (OMIM Ref. No. 606558). Comparative genomic hybridization studies showed gains in chromosome region 2p as the most common imbalance in classical Hodgkin lymphoma. The minimal region of gain contained 2 candidate oncogenes, REL and BCL11A. Martin-Subero et al. (2002) examined the involvement of REL and BCL11A loci in 44 primary cases of classic Hodgkin lymphoma by combined immunophenotyping and interphase cytogenetics. A median 2p13 copy number above the tetraploid range was detected in 24 (55%) cases. One case displayed selective amplification of the REL locus not affecting BCL11A. Two other cases showed evidence of breakpoints in the region spanned by the REL probe.

These data indicated that REL rather than BCL11A may be the target of the 2p13 alterations in classic Hodgkin lymphoma.

[12413] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12414] Satterwhite, E.; Sonoki, T.; Willis, T. G.; Harder, L.; Nowak, R.; Arriola, E. L.; Liu, H.; Price, H. P.; Gesk, S.; Steinemann, D.; Schlegelberger, B.; Oscier, D. G.; Siebert, R.; Tucker, P. W.; Dyer, M. J. S. : The BCL11 gene family: involvement of BCL11A in lymphoid malignancies. Blood 98: 3413–3420, 2001. ; and

[12415] Martin-Subero, J. I.; Gesk, S.; Harder, L.; Sonoki, T.; Tucker, P. W.; Schlegelberger, B.; Grote, W.; Novo, F. J.; Calasanz, M. J.; Hansmann, M. L.; Dyer, M. J. S.; Siebert, R. : Recurr.

[12416] Further studies establishing the function and utilities of BCL11A are found in John Hopkins OMIM database record ID 606557, and in cited publications numbered 11660–5556 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CDT6 (Accession NM_021146) is another VGAM190 host target gene. CDT6 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by CDT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDT6 BINDING SITE, designated SEQ ID:22120, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:2901.

[12417] Another function of VGAM190 is therefore inhibition of CDT6 (Accession NM_021146). Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDT6. GFR (Accession NM_012294) is another VGAM190 host target gene. GFR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFR BINDING SITE, designated SEQ ID:14634, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:2901.

[12418] Another function of VGAM190 is therefore inhibition of

GFR (Accession NM_012294). Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFR. Hemogen (HEMGN, Accession NM_018437) is another VGAM190 host target gene. HEMGN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HEMGN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEMGN BINDING SITE, designated SEQ ID:20499, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:2901.

[12419] Another function of VGAM190 is therefore inhibition of Hemogen (HEMGN, Accession NM_018437). Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMGN. KIAA0155 (Accession NM_014633) is another VGAM190 host target gene. KIAA0155 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0155 BINDING SITE, designated SEQ ID:16001, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:2901.

[12420] Another function of VGAM190 is therefore inhibition of KIAA0155 (Accession NM_014633). Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0155. Ubiquitin Specific Protease 25 (USP25, Accession NM_013396) is another VGAM190 host target gene. USP25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP25 BINDING SITE, designated SEQ ID:15048, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:2901.

[12421] Another function of VGAM190 is therefore inhibition of Ubiquitin Specific Protease 25 (USP25, Accession NM_013396). Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with USP25. LOC200269 (Accession XM_114175) is another VGAM190 host target gene. LOC200269 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200269, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200269 BINDING SITE, designated SEQ ID:42762, to the nucleotide sequence of VGAM190 RNA, herein designated VGAM RNA, also designated SEQ ID:2901.

[12422] Another function of VGAM190 is therefore inhibition of LOC200269 (Accession XM_114175). Accordingly, utilities of VGAM190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200269. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 191 (VGAM191) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12423] VGAM191 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM191 was detected is described hereinabove with reference to Figs. 1–8.

[12424] VGAM191 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM191 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12425] VGAM191 gene encodes a VGAM191 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM191 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM191 precursor RNA is designated SEQ ID:177, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:177 is located at position 229393 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12426] VGAM191 precursor RNA folds onto itself, forming VGAM191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12427] An enzyme complex designated DICER COMPLEX, `dices` the VGAM191 folded precursor RNA into VGAM191 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM191 RNA is designated SEQ ID:2902, and is provided hereinbelow with reference to the sequence listing part.

[12428] VGAM191 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM191 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM191 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[12429] VGAM191 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM191 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM191 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM191 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM191 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12430] The complementary binding of VGAM191 RNA, herein designated VGAM RNA, to host target binding sites on VGAM191 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM191 host target RNA into VGAM191 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12431] It is appreciated that VGAM191 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM191 host target genes. The mRNA of each one of this plurality of VGAM191 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM191 RNA, herein designated VGAM RNA, and which when bound by VGAM191 RNA causes inhibition of translation of respective one or more VGAM191 host target proteins.

[12432] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM191 gene, herein designated VGAM GENE, on one or more VGAM191 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12433] It is yet further appreciated that a function of VGAM191 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM191 correlate with, and may be deduced from, the identity of the host target genes which VGAM191 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [12434] Nucleotide sequences of the VGAM191 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM191 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM191 are further described hereinbelow with reference to Table 1.
- [12435] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM191 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM191 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [12436] As mentioned hereinabove with reference to Fig. 1, a function of VGAM191 gene, herein designated VGAM is inhibition of expression of VGAM191 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM191 correlate with, and may be deduced from, the identity of the target genes which VGAM191 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [12437] Chediak-Higashi Syndrome 1 (CHS1, Accession

NM_000081) is a VGAM191 host target gene. CHS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHS1 BINDING SITE, designated SEQ ID:5525, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12438] A function of VGAM191 is therefore inhibition of Chediak-Higashi Syndrome 1 (CHS1, Accession NM_000081), a gene which may sort endosomal resident proteins into late multivesicular endosome. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHS1. The function of CHS1 has been established by previous studies. Barbosa et al. (1997) identified novel mutations within the region of the coding domain common to both CHS1 isoforms in 3 CHS patients: C-to-T transitions that generated stop codons (R50X; 606897.0006 and Q1029X; 606897.0007) were found in 2 patients, and a novel frameshift mutation (deletion of nucleotides 3073 and 3074 of the coding domain) was found in a third. North-

ern blots of lymphoblastoid mRNA from CHS patients revealed loss of the largest transcript (approximately 13.5 kb) in 2 of 7 CHS patients, while the small mRNA was undiminished in abundance. These results suggested that the small isoform alone cannot complement Chediak–Higashi syndrome. All beige and CHS1 mutations that had been identified were predicted to result in either truncated or absent proteins. Although Perou et al. (1996) and Barbosa et al. (1996) reported identification of the 'beige' gene, the 2 cDNAs were quite different. Nagle et al. (1996) described the sequence of a human cDNA homologous to mouse 'beige,' identified pathologic mutations in patients with Chediak–Higashi syndrome, and clarified the discrepancies of the previous reports of sequence. Analysis of the CHS1 polypeptide demonstrated that its modular architecture is similar to that of the yeast vacuolar sorting protein VPS15. Nagle et al. (1996) screened human cDNA libraries with mouse 'beige' probes to yield the human 'beige' cDNA homolog, and found 87.9% amino acid identity between the 2 sequences. The predicted human protein comprises 3,801 amino acids, with a molecular mass of approximately 43 kD. Barbosa et al. (1997) reported the sequences of 2 major mRNA isoforms of the CHS1

gene in human and mouse. These isoforms differ both in size and in sequence at the 3-prime end of their coding domains, with a small isoform (approximately 5.8 kb) arising from incomplete splicing and reading through an intron. These mRNAs also differ in tissue distribution of transcription and in predicted biologic properties.

[12439] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12440] Karim, M. A.; Nagle, D. L.; Kandil, H. H.; Burger, J.; Moore, K. J.; Spritz, R. A. : Mutations in the Chediak–Higashi syndrome gene (CHS1) indicate requirement for the complete 3801 amino acid CHS protein. Hum. Molec. Genet. 6: 1087–1089, 1997. ; and

[12441] Barbosa, M. D. F. S.; Barrat, F. J.; Tchernev, V. T.; Nguyen, Q. A.; Mishra, V. S.; Colman, S. D.; Pastural, E.; Dufourcq-Lagelouse, R.; Fischer, A.; Holcombe, R. F.; Wallace, M. R.; Bra.

[12442] Further studies establishing the function and utilities of CHS1 are found in John Hopkins OMIM database record ID 606897, and in cited publications numbered 10101, 10102–10104, 5267–5268, 4584, 5269, 10105–1010 and 5270–5271 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. E1A Binding Protein P300 (EP300, Accession NM_001429) is another VGAM191 host target gene. EP300 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EP300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EP300 BINDING SITE, designated SEQ ID:7153, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12443] Another function of VGAM191 is therefore inhibition of E1A Binding Protein P300 (EP300, Accession NM_001429), a gene which may have a function in cell cycle regulation. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EP300. The function of EP300 has been established by previous studies. The growth-controlling functions of the adenovirus E1A oncoprotein depend on its ability to interact with a set of cellular proteins. Among these are the retinoblastoma protein, p107, p130, and p300. Eckner et al. (1994) isolated a cDNA encoding full-length human p300. p300 contains 3 cysteine- and histi-

dine-rich regions of which the most carboxy-terminal region interacts specifically with E1A. In its center, p300 contains a bromodomain, a hallmark of certain transcriptional coactivators. p300 and CREB-binding protein (CREBBP, or CBP; 600140) are highly related in primary structure (Arany et al., 1994). Several protein motifs such as a bromodomain, a KIX domain, and 3 regions rich in cys/his residues are well conserved between these 2 proteins. Animal model experiments lend further support to the function of EP300. The EP300 protein is a histone acetyltransferase that regulates transcription via chromatin remodeling and is important in the processes of cell proliferation and differentiation. A role for EP300 in cancer had been implied by the fact that it is targeted by viral oncoproteins (Arany et al., 1995), it is fused to MLL (OMIM Ref. No. 159555) in leukemia (Ida et al., 1997), and 2 missense sequence alterations in EP300 were identified in epithelial malignancies (Muraoka et al., 1996). Gayther et al. (2000) described EP300 mutations that predicted a truncated protein in 6 (3%) of 193 epithelial cancers analyzed. Of these 6 mutations, 2 were in primary tumors (a colorectal cancer and a breast cancer) and 4 were in cancer cell lines (colorectal, breast, and pancreatic). In addi-

tion, they identified a somatic in-frame insertion in a primary breast cancer and missense alterations in a primary colorectal cancer and 2 cell lines (breast and pancreatic). Inactivation of the second allele was demonstrated in 5 of the 6 cases with truncating mutations and in 2 other cases. The data showed that EP300 is mutated in epithelial cancers and provided the first evidence that it behaves as a classic tumor suppressor gene.

[12444] It is appreciated that the abovementioned animal model for EP300 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[12445] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12446] Tini, M.; Benecke, A.; Um, S.-J.; Torchia, J.; Evans, R. M.; Chambon, P. : Association of CBP/p300 acetylase and thymine DNA glycosylase links DNA repair and transcription. *Molec. Cell* 9: 265–277, 2002. ; and

[12447] Lin, C. H.; Hare, B. J.; Wagner, G.; Harrison, S. C.; Maniatis, T.; Fraenkel, E. : A small domain of CBP/p300 binds diverse proteins: solution structure and functional studies. *Molec. C.*

[12448] Further studies establishing the function and utilities of EP300 are found in John Hopkins OMIM database record ID 602700, and in cited publications numbered 7969, 10673, 1792, 7102, 10674, 3381, 10686–1068 and 1045 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. GA Binding Protein Transcription Factor, Beta Subunit 1, 53kDa (GABPB1, Accession NM_005254) is another VGAM191 host target gene. GABPB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GABPB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABPB1 BINDING SITE, designated SEQ ID:11760, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12449] Another function of VGAM191 is therefore inhibition of GA Binding Protein Transcription Factor, Beta Subunit 1, 53kDa (GABPB1, Accession NM_005254), a gene which activates adenovirus E4 gene transcription. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with GABPB1. The function of GABPB1 has been established by previous studies. The GA-binding protein transcription factor, also called nuclear respiratory factor-2 (NRF2), was originally identified through its role in the expression of the adenovirus E4 gene. The GABP complex contributes to the transcriptional regulation of a number of subunits of mitochondrial enzymes, including cytochrome c oxidase (CO; OMIM Ref. No. 516030).

[12450] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12451] Gugneja, S.; Virbasius, J. V.; Scarpulla, R. C. : Four structurally distinct, non-DNA-binding subunits of human nuclear respiratory factor 2 share a conserved transcriptional activation domain. *Molec. Cell. Biol.* 15: 102-111, 1995. ; and

[12453] Further studies establishing the function and utilities of GABPB1 are found in John Hopkins OMIM database record ID 600610, and in cited publications numbered 10057,

1005 and 10061 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Low Density Lipoprotein Receptor–related Protein 8, Apolipoprotein E Receptor (LRP8, Accession NM_004631) is another VGAM191 host target gene. LRP8 BINDING SITE1 and LRP8 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LRP8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP8 BINDING SITE1 and LRP8 BINDING SITE2, designated SEQ ID:11004 and SEQ ID:27128 respectively, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12454] Another function of VGAM191 is therefore inhibition of Low Density Lipoprotein Receptor–related Protein 8, Apolipoprotein E Receptor (LRP8, Accession NM_004631), a gene which binds vldl and transports it into cells by endocytosis. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP8. The function of LRP8 has been established by previous studies. Apolipoprotein E (APOE; 107741) is a 34–kD lipophilic protein that medi–

ates high-affinity binding of APOE-containing lipoproteins to the low density lipoprotein receptor (see OMIM Ref. No. LDLR; 606945) and the very low density lipoprotein receptor (VLDLR; 192977). By screening a human placenta cDNA library with degenerate oligonucleotides based on a highly conserved region between LDLR and VLDLR, Kim et al. (1996) identified a cDNA encoding APOE receptor-2 (OMIM Ref. No. APOER2). The predicted 963-amino acid protein contains a putative 41-amino acid signal sequence and 5 functional domains that resemble those of LDLR and VLDLR. APOER2 appears specific for APOE-containing ligands: LDLR-deficient mammalian cells expressing APOER bound APOE-rich beta-VLDL with high affinity, but bound LDL and VLDL with much lower affinities. Northern blot analysis revealed that APOER2 is expressed as 4.5- and 8.5-kb mRNAs in brain and placenta Kim et al. (1997) reported that the APOER2 gene contains 19 exons and spans approximately 60 kb. Alternative splicing generates multiple transcripts encoding receptors with different numbers of cysteine-rich repeats in the ligand-binding domain

[12455] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [12456] Kim, D.-H.; Iijima, H.; Goto, K.; Sakai, J.; Ishii, H.; Kim, H.-J.; Suzuki, H.; Kondo, H.; Saeki, S.; Yamamoto, T. : Human apolipoprotein E receptor 2: a novel lipoprotein receptor of the low density lipoprotein receptor family predominantly expressed in brain. J. Biol. Chem. 271: 8373-8380, 1996. ; and

- [12458] Further studies establishing the function and utilities of LRP8 are found in John Hopkins OMIM database record ID 602600, and in cited publications numbered 10019-825 and 10024 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neurexin 1 (NRXN1, Accession NM_004801) is another VGAM191 host target gene. NRXN1 BINDING SITE1 and NRXN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NRXN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

NRXN1 BINDING SITE1 and NRXN1 BINDING SITE2, designated SEQ ID:11223 and SEQ ID:28997 respectively, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12459] Another function of VGAM191 is therefore inhibition of Neurexin 1 (NRXN1, Accession NM_004801), a gene which may be involved in cell recognition, cell adhesion, and mediate intracellular signaling. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRXN1. The function of NRXN1 has been established by previous studies. Neurexins are polymorphic cell surface proteins that are expressed in neurons. They were discovered by Ushkaryov et al. (1992) in the course of cloning the presynaptic receptor for alpha-latrotoxin. Three neurexin genes, designated 1 (NRXN1), 2 (NRXN2; 600566), and 3 (NRXN3; 600567), were identified in a rat brain cDNA library by Ushkaryov et al. (1992). Ichtchenko et al. (1995) observed that each neurexin gene has 2 independent promoters which generate 2 classes of mRNAs: the longer mRNAs encode alpha-neurexins and the shorter mRNAs encode beta-neurexins. Thus, 6 principal neurexin isoforms, called neurexins I-alpha to III-beta, result, of

which neurexin I-alpha corresponds to the high molecular weight component of the alpha-latrotoxin receptor.

Ushkaryov et al. (1992) showed that rat neurexins are expressed at significant levels only in brain. Ullrich et al. (1995) found that the 6 rat neurexin isoforms are coexpressed in neurons and are distributed differentially in various brain regions. Neurexins display a remarkable evolutionarily conserved pattern of extensive alternative splicing. As a result, the total number of neurexins in brain probably exceeds 2,000 (Ullrich et al., 1995).

Neurexins contain epidermal growth factor-like sequences and domains homologous to the G domain repeats of laminin A (LAMA; 150320), indicating a function in cell-cell interactions. Animal model experiments lend further support to the function of NRXN1. Alpha-latrotoxin is a potent neurotoxin from black widow spider venom that binds to presynaptic receptors and causes massive neurotransmitter release. In rat, 2 alpha-latrotoxin receptors have been identified: neurexin I-alpha, which binds the toxin in a calcium-dependent manner, and CIRL/latrophilin, which binds in a calcium-independent manner. Geppert et al. (1998) isolated the mouse neurexin I-alpha gene and found that it contains a large first exon of more

than 1.5 kb that extends to the first site of alternative splicing in the coding region. To evaluate the importance of neurexin I- α in α -latrotoxin action, Geppert et al. (1998) generated mice carrying a deletion of the first exon of the neurexin I- α gene. Homozygous mutant mice lacked neurexin I- α , although the levels of neurexin I- β were unaffected. The mutant mice were viable and fertile, and were indistinguishable in appearance from wildtype animals. The only abnormality observed was that female knockout mice were less able to attend to litters, leading to the death of more pups independent of pup genotype. Geppert et al. (1998) found that α -latrotoxin binding to brain membranes from mutant mice was decreased by almost 50% compared with wildtype membranes. In cultured hippocampal neurons from mutant mice, the toxin was still capable of activating neurotransmission. However, measurements of glutamate release from synaptosomes indicated a major decrease in the amount of release triggered by α -latrotoxin in the presence of calcium. The authors concluded that neurexin I- α is not essential for α -latrotoxin action but contributes to toxin action when calcium is present. They suggested that the action of α -latrotoxin may be me-

diated by independent parallel pathways.

[12460] It is appreciated that the abovementioned animal model for NRXN1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[12461] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12462] Geppert, M.; Khvotchev, M.; Krasnoperov, V.; Goda, Y.; Missler, M.; Hammer, R. E.; Ichtchenko, K.; Petrenko, A. G.; Sudhof, T. C. : Neurexin I-alpha is a major alpha-latrotoxin receptor that cooperates in alpha-latrotoxin action. J. Biol. Chem. 273: 1705-1710, 1998. ; and

[12463] Ushkaryov, Y. A.; Petrenko, A. G.; Geppert, M.; Sudhof, T. C. : Neurexins: synaptic cell surface proteins related to the alpha-latrotoxin receptor and laminin. Science 257: 50-56, 199.

[12464] Further studies establishing the function and utilities of NRXN1 are found in John Hopkins OMIM database record ID 600565, and in sited publications numbered 8169-8173, 673 and 9525-9528 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pleckstrin Homology, Sec7 and Coiled/

coil Domains 3 (PSCD3, Accession NM_004227) is another VGAM191 host target gene. PSCD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSCD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSCD3 BINDING SITE, designated SEQ ID:10423, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12465] Another function of VGAM191 is therefore inhibition of Pleckstrin Homology, Sec7 and Coiled/coil Domains 3 (PSCD3, Accession NM_004227), a gene which regulates vesicle trafficking in eukaryotic cells. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSCD3. The function of PSCD3 has been established by previous studies. ADP-ribosylation factors, or ARFS (see OMIM Ref. No. ARF1; 103180), are small GTP-binding proteins within the Ras superfamily that regulate vesicle trafficking in eukaryotic cells. ARF1 recruits coat proteins (e.g., COPA; 601924) to membranes on the cytoplasmic face of the Golgi apparatus. The PSCD proteins (e.g., PSCD1;

182115), a family of proteins containing a C-terminal pleckstrin homology (PH) domain and a central 200-amino acid region similar to a domain within the yeast Sec7 protein, which is required for vesicular traffic of polypeptides through the Golgi, function as guanine-nucleotide exchange factors (GEFs) for ARFs. Klarlund et al. (1997) identified a cDNA encoding mouse Grp1 (general receptor for phosphoinositides-1) by screening mouse adipocyte and brain cDNA expression libraries with phosphoinositide probes. By searching an EST database for sequences similar to mouse brain Grp1, followed by PCR and screening of a human blood cDNA library, Venkateswarlu et al. (1998) obtained a cDNA encoding PSCD3, which they called GRP1. Sequence analysis showed that the predicted 399-amino acid PSCD3 protein contains a 39-amino acid coiled-coil domain, a 172-amino acid Sec7 domain, and a 118-amino acid PH domain. PSCD3 shares 82.7% and 79.5% amino acid identity with PSCD1 and PSCD2 (OMIM Ref. No. 602488), respectively, as well as 98.8% identity with mouse Grp1. By Scatchard and mutational analyses, Venkateswarlu et al. (1998) determined that PSCD3 binds via its PH domain to the inositol head group of phosphatidylinositol 3,4,5-triphosphate with

high affinity. Confocal laser microscopy demonstrated that stimulation of cells with either epidermal growth factor (EGF; 131530) or nerve growth factor (NGF; 162030) results in PH domain-dependent translocation of PSCD3 from the cytosol to the plasma membrane. The translocation was rapid and transient with EGF, whereas NGF mediated a relatively longer translocation. By searching an EST database for Sec7 domain-related sequences and by screening a placenta cDNA library, Franco et al. (1998) isolated a cDNA encoding PSCD3, which they called ARNO3. Northern blot analysis revealed that PSCD3, in contrast to the ubiquitously expressed PSCD1 and PSCD2, is expressed as a 4.5-kb transcript that is almost absent from liver, thymus, and peripheral blood lymphocytes. Franco et al. (1998) found that PSCD3, like PSCD1 and PSCD2, shows GEF activity, mediated by the Sec7 domain, towards ARF1 but not ARF6 (OMIM Ref. No. 600464). Immunofluorescence microscopy indicated that overexpression of PSCD3 induces major morphologic alterations of the Golgi apparatus, including redistribution of Golgi resident proteins and the coat protein COPB (OMIM Ref. No. 600959). Lietzke et al. (2000) and Ferguson et al. (2000) determined the structure of the GRP1 PH domain in the

unliganded form and bound to inositol

1,3,4,5-tetraphosphate. Lietzke et al. (2000) found that a novel mode of phosphoinositide recognition involving a 20-residue insertion within the beta-6/beta-7 loop explains the unusually high specificity of the GRP1 PH domain and the promiscuous 3-phosphoinositide binding typical of several other PH domains, including that of protein kinase B (AKT1; 164730). By comparing the GRP1 PH domain to other PH domains, general determinants of 3-phosphoinositide recognition and specificity could be deduced. The International Radiation Hybrid Mapping Consortium mapped the PSCD3 gene to chromosome 7 (SHGC-35947).

[12466] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12467] Ferguson, K. M.; Kavran, J. M.; Sankaran, V. G.; Fournier, E.; Isakoff, S. J.; Skolnik, E. Y.; Lemmon, M. A. : Structural basis for discrimination of 3-phosphoinositides by pleckstrin homology domains. *Molec. Cell* 6: 373-384, 2000. ; and

[12468] Franco, M.; Boretto, J.; Robineau, S.; Monier, S.; Goud, B.; Chardin, P.; Chavrier, P. : ARNO3, a Sec7-domain guanine

nucleotide exchange factor for ADP ribosylation factor 1, is involv.

[12469] Further studies establishing the function and utilities of PSCD3 are found in John Hopkins OMIM database record ID 605081, and in cited publications numbered 6807–6809, 490 and 6596 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Recombination Activating Gene 1 (RAG1, Accession NM_000448) is another VGAM191 host target gene. RAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAG1 BINDING SITE, designated SEQ ID:6037, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12470] Another function of VGAM191 is therefore inhibition of Recombination Activating Gene 1 (RAG1, Accession NM_000448). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG1. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 5 (RPS6KA5, Accession

NM_004755) is another VGAM191 host target gene. RPS6KA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPS6KA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA5 BINDING SITE, designated SEQ ID:11144, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12471] Another function of VGAM191 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 5 (RPS6KA5, Accession NM_004755), a gene which plays an essential role in the proliferation of yeast cells. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA5. The function of RPS6KA5 has been established by previous studies. Members of the extracellular signal-regulated kinase (ERK) subfamily of the mitogen-activated protein kinases (MAPKs) are activated by growth factors (see OMIM Ref. No. ERK2, 176948), while stress-activated protein kinase (SAPK) subfamily members are strongly activated by stress signals (see OMIM Ref. No.

SAPK4, 602899). MAPKAP-K1 (see OMIM Ref. No. RPS6KA1, 601684) isoforms appear to be in vivo substrates for ERKs, while MAPKAP-K2 (OMIM Ref. No. 602006) and MAPKAP-K3 (OMIM Ref. No. 602130) are in vivo substrates for SAPK2A (OMIM Ref. No. 600289) and SAPK2B (OMIM Ref. No. 602898). The MAPKAP-K1 proteins each contain 2 protein kinase domains within a single polypeptide, and 1 role of the C-terminal kinase domain is to activate the N-terminal kinase domain. By searching an EST database with the sequence of the MAPKAP-K1 N-terminal kinase domain, Deak et al. (1998) identified cDNAs encoding 2 novel kinases: mitogen- and stress-activated protein kinase-1 (MSK1) and mitogen- and stress-activated protein kinase-2 (OMIM Ref. No. 603606). The predicted 802-amino acid MSK1 protein contains 2 protein kinase domains, each of which includes the 11 subdomains characteristic of all protein kinases. MSK1 shares 43% protein sequence identity with the MAPKAP-K1 isoforms. Northern blot analysis indicated that MSK1 was expressed as a 4-kb mRNA in all tissues tested, with the highest levels of expression in brain, muscle, and placenta. Immunoelectron microscopy localized MSK1 to the nucleus. MSK1 was activated in vitro and in vivo by ei-

ther ERK or SAPK2 proteins. Deak et al. (1998) presented evidence suggesting that MSK1, rather than MAPKAP-K1 or MAPKAP-K2/K3, mediates activation of the cAMP response element-binding protein (see OMIM Ref. No. CREB1, 123810) and activating transcription factor-1 (OMIM Ref. No. 123803) by either growth factors or stress signals. By radiation hybrid analysis, Jiang et al. (1999) mapped the RPS6KA5 gene to chromosome 14q31-q32.

[12472] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12473] Deak, M.; Clifton, A. D.; Lucocq, J. M.; Alessi, D. R. : Mitogen- and stress-activated protein kinase-1 (MSK1) is directly activated by MAPK and SAPK2/p38, and may mediate activation of CREB. EMBO J. 17: 4426-4441, 1998. ; and

[12474] Jiang, C.; Yu, L.; Tu, Q.; Zhao, Y.; Zhang, H.; Zhao, S. : Assignment of a member of the ribosomal protein S6 kinase family, RPS6KA5, to human chromosome 14q31-q32.1 by radiation hybrid map.

[12475] Further studies establishing the function and utilities of RPS6KA5 are found in John Hopkins OMIM database record ID 603607, and in cited publications numbered

2883–2884 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Splicing Factor, Arginine/serine-rich 7, 35kDa (SFRS7, Accession XM_002575) is another VGAM191 host target gene. SFRS7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS7 BINDING SITE, designated SEQ ID:29899, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12476] Another function of VGAM191 is therefore inhibition of Splicing Factor, Arginine/serine-rich 7, 35kDa (SFRS7, Accession XM_002575), a gene which is required for pre-mRNA splicing. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS7. The function of SFRS7 has been established by previous studies. Cavaloc et al. (1994) used a monoclonal antibody to identify a splicing factor of 35 kD which they named 9G8. Based on partial sequence of tryptic peptides, the authors designed degenerate PCR primers and obtained a PCR product

which was used to probe genomic and cDNA libraries. The isolation and characterization of cDNA clones indicated that the 9G8 protein (gene symbol, SFRS7) is a member of the serine/arginine (SR) splicing factor family because it includes an N-terminal RNA binding domain and a C-terminal SR domain. Members of this family are thought to play key roles in alternative splicing. The RNA binding domain of 9G8 is closely related (79 to 71% identity) to those of the SR factors human SRp20 (OMIM Ref. No. 603364) and *Drosophila* RBP1. Immunodepletion of the 9G8 protein from a nuclear extract resulted in the loss of splicing activity. In turn, in vitro-expressed recombinant 9G8 protein rescued the splicing activity of a 9G8-depleted nuclear extract. Popielarz et al. (1995) isolated and characterized the human 9G8 gene. The gene spans 7,745 bp and consists of 8 exons and 7 introns within the coding sequence, thus contrasting with the organization of some other genes of the SR splicing factor family. By isotopic in situ hybridization, they localized the gene to 2p22-p21. The 5-prime flanking region is GC-rich and contains basal promoter sequences and potential regulatory elements. They presented results raising the possibility that alternative splicing of intron 3 provides a mechanism for modu-

lation of the 9G8 function.

[12477] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12478] Cavaloc, Y.; Popielarz, M.; Fuchs, J.-P.; Gattoni, R.; Stevenin, J. : Characterization and cloning of the human splicing factor 9G8: a novel 35 kDa factor of the serine/ arginine protein family. EMBO J. 13: 2639–2649, 1994. ; and

[12480] Further studies establishing the function and utilities of SFRS7 are found in John Hopkins OMIM database record ID 600572, and in cited publications numbered 9532–9533 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily A, Member 2 (SMARCA2, Accession NM_003070) is another VGAM191 host target gene. SMARCA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

SMARCA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCA2 BINDING SITE, designated SEQ ID:9034, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12481] Another function of VGAM191 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily A, Member 2 (SMARCA2, Accession NM_003070), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCA2. The function of SMARCA2 has been established by previous studies. Mammalian SWI/SNF complexes are ATP-dependent chromatin remodeling enzymes that have been implicated in the regulation of gene expression, cell cycle control, and oncogenesis. MyoD (MYOD1; 159970) is a muscle-specific regulator capable of inducing myogenesis in numerous cell types. To ascertain the requirement for chromatin remodeling enzymes in cellular differentiation processes, de la Serna et al.

(2001) examined MyoD-mediated induction of muscle differentiation in fibroblasts expressing dominant-negative versions of the human brahma-related gene-1 (BRG1; 603254) or human brahma, the ATPase subunits of 2 distinct SWI/SNF enzymes. They found that induction of the myogenic phenotype was completely abrogated in the presence of the mutant enzymes. They further demonstrated that failure to induce muscle-specific gene expression correlated with inhibition of chromatin remodeling in the promoter region of an endogenous muscle-specific gene. The results demonstrated that SWI/SNF enzymes promote MyoD-mediated muscle differentiation and indicated that these enzymes function by altering chromatin structure in promoter regions of endogenous, differentiation-specific loci. Hakimi et al. (2002) reported the isolation of a human SNF2-containing chromatin remodeling complex that encompasses components of the cohesin and NURD (see OMIM Ref. No. 603526) complexes. They showed that the RAD21 (OMIM Ref. No. 606462) subunit of the cohesin complex directly interacts with the ATPase subunit SNF2. Mapping of RAD21, SNF2, and Mi2 (see OMIM Ref. No. 603277) binding sites by chromatin immunoprecipitation experiments revealed the

specific association of these 3 proteins with human DNA elements containing alu sequences. Hakimi et al. (2002) found a correlation between modification of histone tails and association of the SNF2/cohesin complex with chromatin. In addition, they showed that the association of the cohesin complex with chromatin can be regulated by the state of DNA methylation. Finally, they presented evidence pointing to a role for the ATPase activity of SNF2 in the loading of RAD21 on chromatin.

[12482] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12483] de la Serna, I. L.; Carlson, K. A.; Imbalzano, A. N. : Mammalian SWI/SNF complexes promote MyoD-mediated muscle differentiation. *Nature Genet.* 27: 187–190, 2001.
; and

[12484] Hakimi, M.–A.; Bochar, D. A.; Schmiesing, J. A.; Dong, Y.; Barak, O. G.; Speicher, D. W.; Yokomori, K.; Shiekhattar, R. : A chromatin remodelling complex that loads cohesin onto human.

[12485] Further studies establishing the function and utilities of SMARCA2 are found in John Hopkins OMIM database record ID 600014, and in cited publications numbered

11144, 8358–836 and 804 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sorting Nexin 9 (SNX9, Accession NM_016224) is another VGAM191 host target gene. SNX9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNX9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX9 BINDING SITE, designated SEQ ID:18328, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12486] Another function of VGAM191 is therefore inhibition of Sorting Nexin 9 (SNX9, Accession NM_016224). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX9. TATA Box Binding Protein (TBP)–associated Factor, RNA Polymerase I, C, 110kDa (TAF1C, Accession NM_005679) is another VGAM191 host target gene. TAF1C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAF1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TAF1C BINDING SITE, designated SEQ ID:12235, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12487] Another function of VGAM191 is therefore inhibition of TATA Box Binding Protein (TBP)–associated Factor, RNA Polymerase I, C, 110kDa (TAF1C, Accession NM_005679), a gene which belongs to component of the RNA polymerase I and II SL1 transcription factor. Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF1C. The function of TAF1C has been established by previous studies. Using immunoaffinity chromatography with anti–TBP, followed by SDS–PAGE analysis, Comai et al. (1994) isolated the purified 110–kD subunit of SL1. By screening teratocarcinoma and HeLa cell cDNA libraries using degenerate PCR primers corresponding to peptide sequences of the 110–kD subunit of SL1, they obtained a cDNA encoding TAF1C, which they called TAFI110. Comai et al. (1994) also obtained cDNAs encoding TAF1A (OMIM Ref. No. 604903) and TAF1B (OMIM Ref. No. 604904). TAF1C encodes a deduced 869–amino acid protein. West–

ern blot analysis confirmed that TAF1C is expressed as a 110-kD protein. Analysis of SL1 subunit interactions showed that all 3 TAF1 proteins bind to TBP and to each other. However, binding of the SL1 complex to TBP excluded binding of the RNA polymerase II transcription factor TFIID (see OMIM Ref. No. TAF2A; 313650) to TBP. Comai et al. (1994) concluded that this mutually exclusive binding directs the formation of promoter- and RNA polymerase-selective TBP-TAF complexes. The International Radiation Hybrid Mapping Consortium mapped the TAF1C gene to 16q (OMIM Ref. No. L39059). Di Pietro et al. (2000) mapped the TAF1C gene to chromosome 16q24 by fluorescence in situ hybridization.

iza.

[12491] Further studies establishing the function and utilities of TAF1C are found in John Hopkins OMIM database record ID 604905, and in cited publications numbered 2910–2911 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072) is another VGAM191 host target gene. C1QR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1QR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QR1 BINDING SITE, designated SEQ ID:14331, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12492] Another function of VGAM191 is therefore inhibition of Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QR1. FLJ22174 (Accession NM_021945) is another VGAM191

host target gene. FLJ22174 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22174 BINDING SITE, designated SEQ ID:22466, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12493] Another function of VGAM191 is therefore inhibition of FLJ22174 (Accession NM_021945). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22174. KIAA0446 (Accession XM_044155) is another VGAM191 host target gene. KIAA0446 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:34154, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12494] Another function of VGAM191 is therefore inhibition of KIAA0446 (Accession XM_044155). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0446. KIAA1211 (Accession XM_044178) is another VGAM191 host target gene. KIAA1211 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1211 BINDING SITE, designated SEQ ID:34160, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12495] Another function of VGAM191 is therefore inhibition of KIAA1211 (Accession XM_044178). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1211. Kelch-like 8 (Drosophila) (KLHL8, Accession XM_031735) is another VGAM191 host target gene. KLHL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL8, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL8 BINDING SITE, designated SEQ ID:31475, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12496] Another function of VGAM191 is therefore inhibition of Kelch-like 8 (Drosophila) (KLHL8, Accession XM_031735). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL8. POU Domain, Class 4, Transcription Factor 2 (POU4F2, Accession NM_004575) is another VGAM191 host target gene. POU4F2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POU4F2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU4F2 BINDING SITE, designated SEQ ID:10919, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12497] Another function of VGAM191 is therefore inhibition of POU Domain, Class 4, Transcription Factor 2 (POU4F2, Accession NM_004575). Accordingly, utilities of VGAM191

include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU4F2.

LOC152756 (Accession XM_098262) is another VGAM191 host target gene. LOC152756 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152756 BINDING SITE, designated SEQ ID:41551, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12498] Another function of VGAM191 is therefore inhibition of LOC152756 (Accession XM_098262). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152756. LOC196528 (Accession XM_113745) is another VGAM191 host target gene. LOC196528 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196528, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC196528 BINDING SITE, designated SEQ ID:42404, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12499] Another function of VGAM191 is therefore inhibition of LOC196528 (Accession XM_113745). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196528. LOC219529 (Accession XM_167563) is another VGAM191 host target gene. LOC219529 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219529 BINDING SITE, designated SEQ ID:44673, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12500] Another function of VGAM191 is therefore inhibition of LOC219529 (Accession XM_167563). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219529. LOC221751 (Accession XM_166370) is another VGAM191 host target gene. LOC221751 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221751, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221751 BINDING SITE, designated SEQ ID:44188, to the nucleotide sequence of VGAM191 RNA, herein designated VGAM RNA, also designated SEQ ID:2902.

[12501] Another function of VGAM191 is therefore inhibition of LOC221751 (Accession XM_166370). Accordingly, utilities of VGAM191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221751. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 192 (VGAM192) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12502] VGAM192 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM192 was detected is described hereinabove with reference to Figs. 1-8.

[12503] VGAM192 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM192 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12504] VGAM192 gene encodes a VGAM192 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM192 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM192 precursor RNA is designated SEQ ID:178, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:178 is located at position 73488 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12505] VGAM192 precursor RNA folds onto itself, forming VGAM192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12506] An enzyme complex designated DICER COMPLEX, `dices` the VGAM192 folded precursor RNA into VGAM192 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM192 RNA is designated SEQ ID:2903, and is provided hereinbelow with reference to the sequence listing part.

[12507] VGAM192 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM192 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM192 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12508] VGAM192 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM192 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM192 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM192 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM192 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12509] The complementary binding of VGAM192 RNA, herein designated VGAM RNA, to host target binding sites on VGAM192 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM192 host target RNA into VGAM192 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12510] It is appreciated that VGAM192 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM192 host target genes. The mRNA of each one of this plurality of VGAM192 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM192 RNA, herein designated VGAM RNA, and which when bound by VGAM192 RNA causes inhibition of translation of respective one or more VGAM192 host target proteins.

[12511] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM192 gene, herein designated VGAM GENE, on one or more VGAM192 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12512] It is yet further appreciated that a function of VGAM192 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM192 correlate with, and may be deduced from, the identity of the host target genes which VGAM192 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12513] Nucleotide sequences of the VGAM192 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM192 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM192 are further described hereinbelow with reference to Table 1.

[12514] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM192 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM192 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12515] As mentioned hereinabove with reference to Fig. 1, a function of VGAM192 gene, herein designated VGAM is inhibition of expression of VGAM192 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM192 correlate with, and may be deduced from, the identity of the target genes which VGAM192 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12516] C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM_013252) is a VGAM192 host target gene. CLECSF5 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by CLECSF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLECSF5 BINDING SITE, designated SEQ ID:14922, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:2903.

[12517] A function of VGAM192 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM_013252). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF5. Nuclear Mitotic Apparatus Protein 1 (NUMA1, Accession XM_167853) is another VGAM192 host target gene. NUMA1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NUMA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUMA1 BINDING SITE, designated SEQ ID:44880, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA,

also designated SEQ ID:2903.

[12518] Another function of VGAM192 is therefore inhibition of Nuclear Mitotic Apparatus Protein 1 (NUMA1, Accession XM_167853), a gene which is nuclear mitotic apparatus protein. Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUMA1. The function of NUMA1 has been established by previous studies. The NuMA protein was one of the first to be described as a cell cycle-related protein based on a distinct immunofluorescent staining pattern: in interphase, NuMA is present throughout the nucleus, and in mitosis, it localizes to the spindle apparatus (Lydersen and Pettijohn, 1980). Some patients with autoimmune disease have antibodies directed against the NuMA protein. The full-length NUMA cDNA (Compton et al., 1992; Yang et al., 1992) predicts a protein with the largest known coiled-coil region in a protein. By fluorescence in situ hybridization, Sparks et al. (1993) demonstrated that the NUMA1 gene is present in single copy and located on 11q13. Acute promyelocytic leukemia (APL) is uniquely associated with chromosomal translocations that disrupt the gene encoding the retinoic acid receptor, RARA (OMIM Ref. No. 180240). In more than

99% of cases, this disruption results in the formation of a fusion of the RARA gene with the PML gene (OMIM Ref. No. 102578). In rare variants of APL, the RARA gene has been found to be fused to 1 of 2 other genes, PLZF (OMIM Ref. No. 176797) and NPM (OMIM Ref. No. 164040). Although RARA dysregulation is evidently important in APL, the role of the various fusion partners is unclear. Wells et al. (1997) characterized a fourth APL gene fusion, which linked exons encoding the retinoic acid and DNA-binding domains of RARA to 5-prime exons of NUMA1. The NUMA/RARA fusion protein existed in sheet-like nuclear aggregates with which normal NUMA partly colocalized. In contrast to t(15;17) APL (the usual variety) the intracellular distribution of PML was normal in these cells. Wells et al. (1997) suggested that interference with retinoid signaling, and not disruption of PML organization, is essential to the APL phenotype. Their work implicated for the first time an element of the mitotic apparatus in the molecular pathogenesis of human malignancy. The proband of their study was a Caucasian male first seen at 6 months of age for investigation of multiple cutaneous lesions. Despite this unusual clinical presentation, peripheral blood morphology and cell-surface immunophenotype were typical of APL.

Routine analysis of diagnostic bone marrow revealed a clonal cytogenetic abnormality, t(11;17)(q13;q21). The patient was treated with all-trans retinoic acid and achieved complete remission; he remained in morphologic remission 38 months after autologous bone marrow transplantation.

[12519] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12520] Lydersen, B. K.; Pettijohn, D. E. : Human-specific nuclear protein that associates with the polar region of the mitotic apparatus: distribution in a human/hamster hybrid cell. Cell 22: 489-499, 1980. ; and

[12521] Wells, R. A.; Catzavelos, C.; Kamel-Reid, S. : Fusion of retinoic acid receptor alpha to NuMA, the nuclear mitotic apparatus protein, by a variant translocation in acute promyelocytic I.

[12522] Further studies establishing the function and utilities of NUMA1 are found in John Hopkins OMIM database record ID 164009, and in cited publications numbered 2246-2252 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 146 (ZNF146, Accession NM_007145) is an-

other VGAM192 host target gene. ZNF146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF146 BINDING SITE, designated SEQ ID:13994, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:2903.

[12523] Another function of VGAM192 is therefore inhibition of Zinc Finger Protein 146 (ZNF146, Accession NM_007145), a gene which binds zinc ions, DNA, and heparin. Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF146. The function of ZNF146 has been established by previous studies. Ferbus et al. (1996) reported the characterization of the human OZF protein. The protein produced in E. coli binds zinc ions, DNA, and heparin. These binding activities are characteristic of zinc finger proteins. Immunochemical analysis using antibodies produced against the recombinant protein detected its expression in human mammary epithelial cells but not in stroma cells, which is consistent with the pattern of ex-

pression observed at the RNA level within cell cultures. Western blot analysis demonstrated the expression of a 33-kD nuclear protein similar in size to the predicted protein and, therefore, excluded the presence of an additional transfer-activating domain. The data established the unique structure of the OZF protein which is distinct from previously identified zinc finger proteins. In addition, OZF protein overexpression was found in a tumor cell line, which suggests a possible involvement in carcinogenesis

[12524] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12525] Le Chalony, C.; Prosperi, M.-T.; Haluza, R.; Apiou, F.; Dutrillaux, B.; Goubin, G. : The OZF gene encodes a protein consisting essentially of zinc-finger motifs. J. Molec. Biol. 236: 399-404, 1994. ; and

[12526] Ferbus, D.; Le Chalony, C.; Prosperi, M.-T.; Muleris, M.; Vincent-Salomon, A.; Goubin, G. : Identification, nuclear localization, and binding activities of OZF, a human protein solely compo.

[12527] Further studies establishing the function and utilities of ZNF146 are found in John Hopkins OMIM database record ID 601505, and in cited publications numbered

9488–9490 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.VI

(Accession NM_013443) is another VGAM192 host target gene. VI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VI BINDING SITE, designated SEQ ID:15108, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:2903.

[12528] Another function of VGAM192 is therefore inhibition of VI (Accession NM_013443). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VI. LOC152263 (Accession XM_098195) is another VGAM192 host target gene. LOC152263 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152263 BINDING SITE, designated SEQ ID:41482, to the nucleotide se-

quence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:2903.

[12529] Another function of VGAM192 is therefore inhibition of LOC152263 (Accession XM_098195). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152263. LOC169966 (Accession XM_093010) is another VGAM192 host target gene. LOC169966 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169966 BINDING SITE, designated SEQ ID:40165, to the nucleotide sequence of VGAM192 RNA, herein designated VGAM RNA, also designated SEQ ID:2903.

[12530] Another function of VGAM192 is therefore inhibition of LOC169966 (Accession XM_093010). Accordingly, utilities of VGAM192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169966. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 193 (VGAM193) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12531] VGAM193 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM193 was detected is described hereinabove with reference to Figs. 1–8.

[12532] VGAM193 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM193 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12533] VGAM193 gene encodes a VGAM193 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM193 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM193 precursor RNA is designated SEQ ID:179, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:179 is located at position 94372 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform

virus).

[12534] VGAM193 precursor RNA folds onto itself, forming VGAM193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12535] An enzyme complex designated DICER COMPLEX, `dices` the VGAM193 folded precursor RNA into VGAM193 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM193 RNA is designated SEQ ID:2904, and is provided hereinbelow with reference to the sequence listing part.

[12536] VGAM193 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM193 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM193 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12537] VGAM193 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM193 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM193 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM193 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM193 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12538] The complementary binding of VGAM193 RNA, herein designated VGAM RNA, to host target binding sites on VGAM193 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM193 host target RNA into VGAM193 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12539] It is appreciated that VGAM193 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM193 host target genes. The mRNA of each one of this plurality of VGAM193 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM193 RNA, herein designated VGAM RNA, and which when bound by VGAM193 RNA causes inhibition of translation of respective one or more VGAM193 host target proteins.

[12540] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM193 gene, herein designated VGAM GENE, on one or more VGAM193 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12541] It is yet further appreciated that a function of VGAM193 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific func-

tions, and accordingly utilities, of VGAM193 correlate with, and may be deduced from, the identity of the host target genes which VGAM193 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12542] Nucleotide sequences of the VGAM193 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM193 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM193 are further described hereinbelow with reference to Table 1.

[12543] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM193 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM193 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12544] As mentioned hereinabove with reference to Fig. 1, a function of VGAM193 gene, herein designated VGAM is inhibition of expression of VGAM193 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM193 correlate with, and may be deduced from, the identity of the target genes which VGAM193 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12545] Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Accession NM_003674) is a VGAM193 host target gene. CDK10 BINDING SITE1 and CDK10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CDK10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK10 BINDING SITE1 and CDK10 BINDING SITE2, designated SEQ ID:9768 and SEQ ID:27557 respectively, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12546] A function of VGAM193 is therefore inhibition of Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Accession NM_003674), a gene which plays a pivotal role in the regulation of the eukaryotic cell cycle. Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK10. The function of CDK10 has been established by previous

studies. Cyclin-dependent kinases (CDKs) are CDC2 (OMIM Ref. No. 116940)-related kinases that bind to cyclin to form active holoenzymes that play a pivotal role in the regulation of the eukaryotic cell cycle. To identify additional CDC2-like protein kinases, Brambilla and Draetta (1994) performed RT-PCR on human tumor cell line mRNA using degenerate oligonucleotides based on regions conserved among CDC2-related proteins. They used a resulting PCR product to screen a HeLa cell library and isolated a partial cDNA encoding a novel protein kinase. The 5-prime end of the cDNA was obtained using RACE. Brambilla and Draetta (1994) designated the predicted 360-amino acid protein PISSLRE, based on the amino acid sequence of the region corresponding to the conserved CDC2 PSTAIRE motif. PISSLRE contains all the structural elements characteristic of CDKs and unique extensions at both ends. Sequence comparisons revealed that it shares 41% and 50% protein sequence identity with CDC2 and CDC2L1 (OMIM Ref. No. 176873), respectively. By Northern blot analysis, the authors determined that PISSLRE was expressed broadly in human tissues as a 2-kb mRNA. An additional 3.5-kb transcript was observed in some tissues. Using a combination of library screening and

5-prime RACE, Grana et al. (1994) isolated PISSLRE cDNAs that differed significantly at both ends from those isolated by Brambilla and Draetta (1994). Brambilla and Draetta (1994) attributed the differences to alternative splicing. Grana et al. (1994) were unable to identify any ATG initiation codons upstream of the sequence encoding the catalytic domain of the putative kinase. They suggested that translation may initiate at 1 of 3 non-ATG initiation codons.

[12547] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12548] Bullrich, F.; MacLachlan, T. K.; Sang, N.; Druck, T.; Veronese, M. L.; Allen, S. L.; Chiorazzi, N.; Koff, A.; Heubner, K.; Croce, C. M.; Giordano, A. : Chromosomal mapping of members of the cdc2 family of protein kinases, cdk3, cdk6, PISSLRE, and PITALRE, and a cdk inhibitor, p27-Kip1, to regions involved in human cancer. *Cancer Res.* 55: 1199-1205, 1995. ; and

[12549] Grana, X.; Claudio, P. P.; De Luca, A.; Sang, N.; Giordano, A. : PISSLRE, a human novel CDC2-related protein kinase. *Oncogene* 9: 2097-2103, 1994.

[12550] Further studies establishing the function and utilities of

CDK10 are found in John Hopkins OMIM database record ID 603464, and in cited publications numbered 288 and 2881 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 4 (ELOVL4, Accession NM_022726) is another VGAM193 host target gene. ELOVL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELOVL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELOVL4 BINDING SITE, designated SEQ ID:22927, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12551] Another function of VGAM193 is therefore inhibition of Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 4 (ELOVL4, Accession NM_022726). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELOVL4. Echinoderm Microtubule Associated Protein Like 1 (EML1, Accession XM_007243) is another VGAM193 host target gene. EML1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML1 BINDING SITE, designated SEQ ID:30036, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12552] Another function of VGAM193 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 1 (EML1, Accession XM_007243). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML1. Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM_003950) is another VGAM193 host target gene. F2RL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F2RL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE, designated SEQ ID:10083, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12553] Another function of VGAM193 is therefore inhibition of Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM_003950), a gene which Protease-activated receptor 4; G protein-coupled receptor that increases phosphoinositide hydrolysis. Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3. The function of F2RL3 has been established by previous studies. Protease-activated receptors 1 (PAR1; 187930), 2 (PAR2; 600933), and 3 (PAR3; 601919) are members of a unique G protein-coupled receptor family. They are characterized by a tethered peptide ligand at the extracellular amino terminus that is generated by minor proteolysis. Xu et al. (1998) identified a partial cDNA sequence of a fourth member of this family, PAR4, in an expressed sequence tag (EST) database, and a full-length cDNA clone was isolated from a lymphoma Daudi cell cDNA library. The open reading frame coded for a 7-transmembrane domain protein of 385 amino acids with 33% amino acid sequence identity with PAR1-3. A putative protease cleavage site was identified within the extracellular amino terminus. Northern blot analysis showed that PAR4 mRNA is expressed in a number of human tissues, with high levels

being present in lung, pancreas, thyroid, testis, and small intestine. By fluorescence in situ hybridization, Xu et al. (1998) mapped the PAR4 gene to 19p12. Animal model experiments lend further support to the function of F2RL3. Sambrano et al. (2001) demonstrated that platelets from Par4-deficient mice failed to change shape, mobilize calcium, secrete ATP, or aggregate in response to thrombin.

[12554] It is appreciated that the abovementioned animal model for F2RL3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[12555] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12556] Xu, W.-F.; Andersen, H.; Whitmore, T. E.; Presnell, S. R.; Yee, D. P.; Ching, A.; Gilbert, T.; Davie, E. W.; Foster, D. C. : Cloning and characterization of human protease-activated receptor 4. Proc. Nat. Acad. Sci. 95: 6642-6646, 1998. ; and

[12557] Sambrano, G. R.; Weiss, E. J.; Zheng, Y.-W.; Huang, W.; Coughlin, S. R. : Role of thrombin signalling in platelets in haemostasis and thrombosis. Nature 413: 74-78, 2001.

[12558] Further studies establishing the function and utilities of F2RL3 are found in John Hopkins OMIM database record ID 602779, and in cited publications numbered 7653, 9406–940 and 7654 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 1 Receptor Antagonist (IL1RN, Accession NM_000577) is another VGAM193 host target gene. IL1RN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1RN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RN BINDING SITE, designated SEQ ID:6180, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12559] Another function of VGAM193 is therefore inhibition of Interleukin 1 Receptor Antagonist (IL1RN, Accession NM_000577), a gene which inhibits the activity of il-1 by binding to its receptor. il-1ra has no il-1 like activity. Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RN. The function of IL1RN has been established by previous studies. Using a homology-based

PCR approach to identify IL1 receptor-related genes, Lovenberg et al. (1996) identified a cDNA, which they called IL1RRP2, that encodes a 561-amino acid protein with significant sequence identity to the IL1 receptor. Like IL1RRP (OMIM Ref. No. 604494), IL1RRP2 failed to bind IL1-alpha (OMIM Ref. No. 147760) or IL1-beta (OMIM Ref. No. 147720). Dale and Nicklin (1999) showed by radiation hybrid mapping that IL1R2 (OMIM Ref. No. 147811), IL1R1 (OMIM Ref. No. 147810), IL1RL2, IL1RL1 (OMIM Ref. No. 601203), and IL18R1 (OMIM Ref. No. 604494) map to 2q12 and are transcribed in the same direction, with IL1R2 being transcribed towards the cluster

[12560] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12561] Dale, M.; Nicklin, M. J. : Interleukin-1 receptor cluster: gene organization of IL1R2, IL1R1, IL1RL2 (IL-1Rrp2), IL1RL1 (T1/ST2), and IL18R1 (IL-1Rrp) on human chromosome 2q. Genomics 57: 177-179, 1999. ; and

[12562] Lovenberg, T. W.; Crowe, P. D.; Liu, C.; Chalmers, D. T.; Liu, X. J.; Liaw, C.; Clevenger, W.; Oltersdorf, T.; De Souza, E. B.; Maki, R. A. : Cloning of a cDNA encoding a novel interleukin.

[12563] Further studies establishing the function and utilities of IL1RN are found in John Hopkins OMIM database record ID 147679, and in cited publications numbered 465–467, 469, 470–472, 4803–4805, 471 and 4806–4808 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Peroxisomal Farnesylated Protein (PXF, Accession NM_002857) is another VGAM193 host target gene. PXF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PXF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXF BINDING SITE, designated SEQ ID:8751, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12564] Another function of VGAM193 is therefore inhibition of Peroxisomal Farnesylated Protein (PXF, Accession NM_002857), a gene which may function in peroxisomal biogenesis or assembly. Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXF. The function of PXF has been established by previous studies. The co–

valent attachment of prenyl lipids, such as farnesyl or geranylgeranyl groups, by specific transferases is indispensable for the cellular sorting of many proteins. James et al. (1994) identified in hamster a farnesylated protein, called peroxisomal farnesylated protein or PxF, that localized to the outer surface of peroxisomes. Kammerer et al. (1997) found that the protein sequence of PxF is 93% identical to that of HK33, a human protein identified by Braun et al. (1994). Braun et al. (1994) reported that HK33 is a predicted 299-amino acid protein with a mass of 33 kD by SDS-PAGE. Northern blot analysis and RT-PCR revealed that HK33 is expressed ubiquitously as 2.2 to 2.5-kb and 4-kb mRNAs. The fact that the gene was transcribed in all cells and tissues tested indicated its status as a house-keeping gene. Braun et al. (1994) demonstrated that at least 2 different HK33 transcripts result from the use of alternative polyadenylation sites. Kammerer et al. (1997) isolated 4 variant HK33, or PXF, mRNAs produced by alternative splicing. They found that the proteins encoded by 2 of the splice variants were farnesylated in vitro. Using immunoelectron microscopy, Kammerer et al. (1997) showed that PXF is localized to the cytoplasmic surface of peroxisomes in liver cells. These authors reported that the

PXF gene contains 8 exons and spans approximately 9 kb. The basal promoter is located within the first 239 bp upstream of the coding region.

[12565] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12566] Braun, A.; Kammerer, S.; Weissenhorn, W.; Weiss, E. H.; Cleve, H. : Sequence of a putative human housekeeping gene (HK33) localized on chromosome 1. Gene 146: 291–295, 1994. ; and

[12567] Kammerer, S.; Arnold, N.; Gutensohn, W.; Mewes, H.–W.; Kunau, W.–H.; Hofler, G.; Roscher, A. A.; Braun, A. : Genomic organization and molecular characterization of a gene encoding HsPX.

[12568] Further studies establishing the function and utilities of PXF are found in John Hopkins OMIM database record ID 600279, and in cited publications numbered 8427–843 and 7739 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DCOHM (Accession NM_032151) is another VGAM193 host target gene. DCOHM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCOHM, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE, designated SEQ ID:25843, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12569] Another function of VGAM193 is therefore inhibition of DCOHM (Accession NM_032151). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM. FLJ32334 (Accession NM_144565) is another VGAM193 host target gene. FLJ32334 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32334, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32334 BINDING SITE, designated SEQ ID:29363, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12570] Another function of VGAM193 is therefore inhibition of FLJ32334 (Accession NM_144565). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ32334. KIAA1391 (Accession XM_040866) is another VGAM193 host target gene. KIAA1391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1391 BINDING SITE, designated SEQ ID:33402, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12571] Another function of VGAM193 is therefore inhibition of KIAA1391 (Accession XM_040866). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1391. NY-REN-60 (Accession XM_040506) is another VGAM193 host target gene. NY-REN-60 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NY-REN-60, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-60 BINDING SITE, designated SEQ ID:33316, to the

nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12572] Another function of VGAM193 is therefore inhibition of NY-REN-60 (Accession XM_040506). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-60. SP329 (Accession NM_030793) is another VGAM193 host target gene. SP329 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SP329, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP329 BINDING SITE, designated SEQ ID:25099, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12573] Another function of VGAM193 is therefore inhibition of SP329 (Accession NM_030793). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP329. Testis-specific Kinase 2 (TESK2, Accession XM_032399) is another VGAM193 host target gene. TESK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by TESK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TESK2 BINDING SITE, designated SEQ ID:31649, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12574] Another function of VGAM193 is therefore inhibition of Testis-specific Kinase 2 (TESK2, Accession XM_032399). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TESK2. LOC147622 (Accession XM_097255) is another VGAM193 host target gene. LOC147622 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147622 BINDING SITE, designated SEQ ID:40849, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12575] Another function of VGAM193 is therefore inhibition of

LOC147622 (Accession XM_097255). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147622. LOC155435 (Accession XM_088257) is another VGAM193 host target gene. LOC155435 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155435 BINDING SITE, designated SEQ ID:39569, to the nucleotide sequence of VGAM193 RNA, herein designated VGAM RNA, also designated SEQ ID:2904.

[12576] Another function of VGAM193 is therefore inhibition of LOC155435 (Accession XM_088257). Accordingly, utilities of VGAM193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155435. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 194 (VGAM194) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[12577] VGAM194 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM194 was detected is described hereinabove with reference to Figs. 1–8.

[12578] VGAM194 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM194 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12579] VGAM194 gene encodes a VGAM194 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM194 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM194 precursor RNA is designated SEQ ID:180, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:180 is located at position 172456 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12580] VGAM194 precursor RNA folds onto itself, forming VGAM194 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[12581] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM194 folded precursor RNA into VGAM194 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 44%) nucleotide se-
quence of VGAM194 RNA is designated SEQ ID:2905, and
is provided hereinbelow with reference to the sequence
listing part.

[12582] VGAM194 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM194 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM194 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12583] VGAM194 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM194 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM194 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM194 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM194 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12584] The complementary binding of VGAM194 RNA, herein designated VGAM RNA, to host target binding sites on VGAM194 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM194 host target RNA into VGAM194 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12585] It is appreciated that VGAM194 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM194 host target genes. The mRNA of each one of this plurality of VGAM194 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM194 RNA, herein designated VGAM RNA, and which when bound by VGAM194 RNA causes inhibition of translation of respective one or more VGAM194 host target proteins.

[12586] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM194 gene, herein designated VGAM GENE, on one or more VGAM194 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12587] It is yet further appreciated that a function of VGAM194 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM194 correlate with, and may be deduced from, the identity of the host target genes which VGAM194 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[12588] Nucleotide sequences of the VGAM194 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM194 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM194 are further described hereinbelow with reference to Table 1.

[12589] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM194 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM194 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12590] As mentioned hereinabove with reference to Fig. 1, a function of VGAM194 gene, herein designated VGAM is inhibition of expression of VGAM194 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM194 correlate with, and may be deduced from, the identity of the target genes which VGAM194 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[12591] A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession NM_007200) is a VGAM194 host target gene. AKAP13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:14055, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:2905.

[12592] A function of VGAM194 is therefore inhibition of A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession NM_007200), a gene which regulates subcellular localization of type II cAMP-dependent PKA. Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13. The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM17. Charot-Leyden Crystal Protein (CLC, Accession NM_013246) is another VGAM194 host target gene. CLC BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by CLC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLC BINDING SITE, designated SEQ ID:14907, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:2905.

[12593] Another function of VGAM194 is therefore inhibition of Charot-Leyden Crystal Protein (CLC, Accession NM_013246). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLC. Fucosyltransferase 6 (alpha (1,3) Fucosyltransferase) (FUT6, Accession NM_000150) is another VGAM194 host target gene. FUT6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FUT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT6 BINDING SITE, designated SEQ ID:5648, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:2905.

[12594] Another function of VGAM194 is therefore inhibition of

Fucosyltransferase 6 (alpha (1,3) Fucosyltransferase) (FUT6, Accession NM_000150), a gene which is involved in the biosynthesis of the e-selectin ligand, sialyl-lewis x. catalyzes the transfer of fucose from gdp- beta-fucose to alpha-2,3 sialylated substrates. Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT6. The function of FUT6 has been established by previous studies. The alpha-1,3-fucosyltransferases constitute a large family of glycosyltransferases with a high degree of homology. The enzymes of this family comprise 3 main activity patterns called myeloid, plasma, and Lewis, based on their capacity to transfer alpha-L-fucose to distinct oligosaccharide acceptors, their sensitivity to N-ethylmaleimide inhibition, their cation requirements, and their tissue-specific expression patterns. The different categories of alpha-1,3-fucosyltransferases are sequentially expressed during embryo-fetal development.

[12595] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12596] Brinkman-Van der Linden, E. C. M.; Mollicone, R.; Oriol, R.; Larson, G.; Van den Eijnden, D. H.; Van Dijk, W. : A

missense mutation in the FUT6 gene results in total absence of alpha-3-fucosylation of human alpha-1-acid glycoprotein. J. Biol. Chem. 271: 14492-14495, 1996. ; and

[12597] Cameron, H. S.; Szczepaniak, D.; Weston, B. W. : Expression of human chromosome 19p alpha-(1,3)-fucosyltransferase genes in normal tissues: alternative splicing, polyadenylation, and is.

[12598] Further studies establishing the function and utilities of FUT6 are found in John Hopkins OMIM database record ID 136836, and in cited publications numbered 2180, 2983-2984, 2177, 2985-298 and 2179 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 20 Open Reading Frame 19 (C20orf19, Accession NM_018474) is another VGAM194 host target gene. C20orf19 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf19 BINDING SITE, designated SEQ ID:20541, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM

RNA, also designated SEQ ID:2905.

[12599] Another function of VGAM194 is therefore inhibition of Chromosome 20 Open Reading Frame 19 (C20orf19, Accession NM_018474). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf19. DKFZp434O0320 (Accession XM_097012) is another VGAM194 host target gene. DKFZp434O0320 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434O0320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434O0320 BINDING SITE, designated SEQ ID:40702, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:2905.

[12600] Another function of VGAM194 is therefore inhibition of DKFZp434O0320 (Accession XM_097012). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434O0320. FLJ12934 (Accession NM_022899) is another VGAM194 host target gene. FLJ12934 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12934 BINDING SITE, designated SEQ ID:23173, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:2905.

[12601] Another function of VGAM194 is therefore inhibition of FLJ12934 (Accession NM_022899). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12934. FLJ13441 (Accession NM_023924) is another VGAM194 host target gene. FLJ13441 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13441 BINDING SITE, designated SEQ ID:23389, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:2905.

[12602] Another function of VGAM194 is therefore inhibition of

FLJ13441 (Accession NM_023924). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13441. FLJ20079 (Accession NM_017656) is another VGAM194 host target gene. FLJ20079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19175, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:2905.

[12603] Another function of VGAM194 is therefore inhibition of FLJ20079 (Accession NM_017656). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. KIAA0426 (Accession NM_014724) is another VGAM194 host target gene. KIAA0426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0426 BINDING SITE, designated SEQ ID:16305, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:2905.

[12604] Another function of VGAM194 is therefore inhibition of KIAA0426 (Accession NM_014724). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0426. KIAA1143 (Accession XM_044014) is another VGAM194 host target gene. KIAA1143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE, designated SEQ ID:34074, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:2905.

[12605] Another function of VGAM194 is therefore inhibition of KIAA1143 (Accession XM_044014). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1143. Synaptojanin 2 (SYNJ2, Accession XM_029746)

is another VGAM194 host target gene. SYNJ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNJ2 BINDING SITE, designated SEQ ID:30941, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:2905.

[12606] Another function of VGAM194 is therefore inhibition of Synaptojanin 2 (SYNJ2, Accession XM_029746). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNJ2. LOC220776 (Accession XM_043388) is another VGAM194 host target gene. LOC220776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33928, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:2905.

[12607] Another function of VGAM194 is therefore inhibition of LOC220776 (Accession XM_043388). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220776. LOC257239 (Accession XM_173125) is another VGAM194 host target gene. LOC257239 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257239 BINDING SITE, designated SEQ ID:46372, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:2905.

[12608] Another function of VGAM194 is therefore inhibition of LOC257239 (Accession XM_173125). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257239. LOC90594 (Accession XM_032820) is another VGAM194 host target gene. LOC90594 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90594, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90594 BINDING SITE, designated SEQ ID:31773, to the nucleotide sequence of VGAM194 RNA, herein designated VGAM RNA, also designated SEQ ID:2905.

[12609] Another function of VGAM194 is therefore inhibition of LOC90594 (Accession XM_032820). Accordingly, utilities of VGAM194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90594. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 195 (VGAM195) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12610] VGAM195 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM195 was detected is described hereinabove with reference to Figs. 1–8.

[12611] VGAM195 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM195 host

target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12612] VGAM195 gene encodes a VGAM195 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM195 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM195 precursor RNA is designated SEQ ID:181, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:181 is located at position 113163 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12613] VGAM195 precursor RNA folds onto itself, forming VGAM195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12614] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM195 folded precursor RNA into VGAM195 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM195 RNA is designated SEQ ID:2906, and is provided hereinbelow with reference to the sequence listing part.

[12615] VGAM195 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM195 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM195 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12616] VGAM195 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM195 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM195 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM195 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM195 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12617] The complementary binding of VGAM195 RNA, herein designated VGAM RNA, to host target binding sites on VGAM195 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM195 host target RNA into VGAM195 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12618] It is appreciated that VGAM195 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM195 host target genes. The mRNA of each one of this plurality of VGAM195 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM195 RNA, herein designated VGAM RNA, and which when bound by VGAM195 RNA causes inhibition of translation of respective one or more VGAM195 host target proteins.

[12619] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM195 gene, herein designated VGAM GENE, on one or more VGAM195 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12620] It is yet further appreciated that a function of VGAM195 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM195 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM195 correlate with, and may be deduced from, the identity of the host target genes which VGAM195 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12621] Nucleotide sequences of the VGAM195 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM195 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM195 are further

described hereinbelow with reference to Table 1.

[12622] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM195 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM195 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12623] As mentioned hereinabove with reference to Fig. 1, a function of VGAM195 gene, herein designated VGAM is inhibition of expression of VGAM195 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM195 correlate with, and may be deduced from, the identity of the target genes which VGAM195 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12624] Collagen, Type X, Alpha 1(Schmid metaphyseal chondrodysplasia) (COL10A1, Accession NM_000493) is a VGAM195 host target gene. COL10A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL10A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of COL10A1 BINDING SITE, designated SEQ ID:6105, to the nucleotide sequence of VGAM195 RNA, herein designated VGAM RNA, also designated SEQ ID:2906.

[12625] A function of VGAM195 is therefore inhibition of Collagen, Type X, Alpha 1(Schmid metaphyseal chondrodysplasia) (COL10A1, Accession NM_000493). Accordingly, utilities of VGAM195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL10A1. COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_004376) is another VGAM195 host target gene. COX15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:10598, to the nucleotide sequence of VGAM195 RNA, herein designated VGAM RNA, also designated SEQ ID:2906.

[12626] Another function of VGAM195 is therefore inhibition of COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_004376). Accordingly, util-

ities of VGAM195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX15. Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM_086728) is another VGAM195 host target gene. C20orf110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf110 BINDING SITE, designated SEQ ID:38830, to the nucleotide sequence of VGAM195 RNA, herein designated VGAM RNA, also designated SEQ ID:2906.

[12627] Another function of VGAM195 is therefore inhibition of Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM_086728). Accordingly, utilities of VGAM195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf110. CGI-142 (Accession NM_016073) is another VGAM195 host target gene. CGI-142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGI-142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGI-142 BINDING SITE, designated SEQ ID:18147, to the nucleotide sequence of VGAM195 RNA, herein designated VGAM RNA, also designated SEQ ID:2906.

[12628] Another function of VGAM195 is therefore inhibition of CGI-142 (Accession NM_016073). Accordingly, utilities of VGAM195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-142. DIS3 (Accession NM_014953) is another VGAM195 host target gene. DIS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIS3 BINDING SITE, designated SEQ ID:17302, to the nucleotide sequence of VGAM195 RNA, herein designated VGAM RNA, also designated SEQ ID:2906.

[12629] Another function of VGAM195 is therefore inhibition of DIS3 (Accession NM_014953). Accordingly, utilities of VGAM195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIS3.

LOC153338 (Accession XM_098361) is another VGAM195 host target gene. LOC153338 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153338 BINDING SITE, designated SEQ ID:41607, to the nucleotide sequence of VGAM195 RNA, herein designated VGAM RNA, also designated SEQ ID:2906.

[12630] Another function of VGAM195 is therefore inhibition of LOC153338 (Accession XM_098361). Accordingly, utilities of VGAM195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153338. LOC202781 (Accession XM_117455) is another VGAM195 host target gene. LOC202781 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202781 BINDING SITE, designated SEQ ID:43444, to the nucleotide sequence of VGAM195 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2906.

[12631] Another function of VGAM195 is therefore inhibition of LOC202781 (Accession XM_117455). Accordingly, utilities of VGAM195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202781. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 196 (VGAM196) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12632] VGAM196 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM196 was detected is described hereinabove with reference to Figs. 1–8.

[12633] VGAM196 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM196 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12634] VGAM196 gene encodes a VGAM196 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM196 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM196 precursor RNA is designated SEQ ID:182, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:182 is located at position 205571 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12635] VGAM196 precursor RNA folds onto itself, forming VGAM196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12636] An enzyme complex designated DICER COMPLEX, `dices` the VGAM196 folded precursor RNA into VGAM196 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM196 RNA is designated SEQ ID:2907, and is provided hereinbelow with reference to the sequence listing part.

[12637] VGAM196 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM196 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM196 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12638] VGAM196 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM196 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM196 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM196 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM196 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12639] The complementary binding of VGAM196 RNA, herein designated VGAM RNA, to host target binding sites on VGAM196 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM196 host target RNA into VGAM196 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12640] It is appreciated that VGAM196 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM196 host target genes. The mRNA of each one of this plurality of VGAM196 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM196 RNA, herein designated VGAM RNA, and which when bound by VGAM196 RNA causes inhibition of translation of respective one or more VGAM196 host target proteins.

[12641] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM196 gene, herein designated VGAM GENE, on one or more VGAM196 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[12642] It is yet further appreciated that a function of VGAM196 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM196 correlate with, and may be deduced from, the identity of the host target genes which VGAM196 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12643] Nucleotide sequences of the VGAM196 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM196 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM196 are further described hereinbelow with reference to Table 1.

[12644] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM196 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM196 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12645] As mentioned hereinabove with reference to Fig. 1, a function of VGAM196 gene, herein designated VGAM is inhibition of expression of VGAM196 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM196 correlate with, and may be deduced from, the identity of the target genes which VGAM196 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12646] ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933) is a VGAM196 host target gene. ATP8B2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ATP8B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:32520, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12647] A function of VGAM196 is therefore inhibition of ATPase,

Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2. Oculocerebrorenal Syndrome of Lowe (OCRL, Accession NM_000276) is another VGAM196 host target gene. OCRL BINDING SITE1 and OCRL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OCRL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OCRL BINDING SITE1 and OCRL BINDING SITE2, designated SEQ ID:5819 and SEQ ID:7306 respectively, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12648] Another function of VGAM196 is therefore inhibition of Oculocerebrorenal Syndrome of Lowe (OCRL, Accession NM_000276). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OCRL. Thymine-DNA Glycosylase (TDG, Accession NM_003211) is another VGAM196 host target gene. TDG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by TDG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TDG BINDING SITE, designated SEQ ID:9206, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12649] Another function of VGAM196 is therefore inhibition of Thymine–DNA Glycosylase (TDG, Accession NM_003211), a gene which excises uracil and thymine from mispairs with guanine. Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TDG. The function of TDG has been established by previous studies. The process of spontaneous hydrolytic deamination affects all DNA bases with exocyclic amino groups (Lindahl, 1982). Hydrolytic deamination of 5–methylcytosine leads to the formation of G/T mismatches. These G/T mismatches are corrected to G/C basepairs by a mismatch–specific DNA–binding glycosylase, TDG. TDG initiates repair of G/T and G/U mismatches, commonly associated with CpG islands, by removing thymine and uracil moieties. Tini et al. (2002) reported that TDG associates with transcriptional coacti–

vators CBP (OMIM Ref. No. 600140) and p300 (OMIM Ref. No. 602700) and that the resulting complexes are competent for both the excision step of repair and histone acetylation. TDG stimulated CBP transcriptional activity in transfected cells and reciprocally served as a substrate for CBP/p300 acetylation. This acetylation triggered release of CBP from DNA ternary complexes and also regulated recruitment of repair endonuclease APE (OMIM Ref. No. 107748). These observations revealed a potential regulatory role for protein acetylation in base mismatch repair and a role for CBP/p300 in maintaining genomic stability.

[12650] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12651] Tini, M.; Benecke, A.; Um, S.-J.; Torchia, J.; Evans, R. M.; Chambon, P. : Association of CBP/p300 acetylase and thymine DNA glycosylase links DNA repair and transcription. *Molec. Cell* 9: 265–277, 2002. ; and

[12652] Neddermann, P.; Gallinari, P.; Lettieri, T.; Schmid, D.; Truong, O.; Hsuan, J. J.; Wiebauer, K.; Jiricny, J. : Cloning and expression of human G/T mismatch-specific thymine–DNA glycosyl.

[12653] Further studies establishing the function and utilities of

TDG are found in John Hopkins OMIM database record ID 601423, and in cited publications numbered 9268–927 and 10686 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BICD2 (Accession XM_046863) is another VGAM196 host target gene. BICD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BICD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BICD2 BINDING SITE, designated SEQ ID:34854, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12654] Another function of VGAM196 is therefore inhibition of BICD2 (Accession XM_046863). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BICD2. Reserved (C8orf13, Accession XM_088377) is another VGAM196 host target gene. C8orf13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C8orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND–

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf13 BINDING SITE, designated SEQ ID:39654, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12655] Another function of VGAM196 is therefore inhibition of Reserved (C8orf13, Accession XM_088377). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf13. DKFZp434D177 (Accession NM_032264) is another VGAM196 host target gene. DKFZp434D177 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434D177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434D177 BINDING SITE, designated SEQ ID:26011, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12656] Another function of VGAM196 is therefore inhibition of DKFZp434D177 (Accession NM_032264). Accordingly, utilities of VGAM196 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp434D177. DKFZp761P1010 (Accession NM_018423) is another VGAM196 host target gene. DKFZp761P1010 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761P1010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761P1010 BINDING SITE, designated SEQ ID:20479, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12657] Another function of VGAM196 is therefore inhibition of DKFZp761P1010 (Accession NM_018423). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761P1010. FLJ10535 (Accession NM_018129) is another VGAM196 host target gene. FLJ10535 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ10535 BINDING SITE, designated SEQ ID:19922, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12658] Another function of VGAM196 is therefore inhibition of FLJ10535 (Accession NM_018129). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10535. FLJ23186 (Accession XM_017088) is another VGAM196 host target gene. FLJ23186 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23186, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23186 BINDING SITE, designated SEQ ID:30297, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12659] Another function of VGAM196 is therefore inhibition of FLJ23186 (Accession XM_017088). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23186. KIAA0495 (Accession XM_031397) is another VGAM196 host target gene. KIAA0495 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by KIAA0495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:31362, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12660] Another function of VGAM196 is therefore inhibition of KIAA0495 (Accession XM_031397). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495. KIAA1126 (Accession XM_050325) is another VGAM196 host target gene. KIAA1126 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1126 BINDING SITE, designated SEQ ID:35611, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12661] Another function of VGAM196 is therefore inhibition of

KIAA1126 (Accession XM_050325). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1126. MKP-7 (Accession XM_039106) is another VGAM196 host target gene. MKP-7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MKP-7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKP-7 BINDING SITE, designated SEQ ID:33009, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12662] Another function of VGAM196 is therefore inhibition of MKP-7 (Accession XM_039106). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKP-7. SCDGF-B (Accession NM_033135) is another VGAM196 host target gene. SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SCDGF-B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2, designated SEQ ID:26984 and SEQ ID:24882 respectively, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12663] Another function of VGAM196 is therefore inhibition of SCDGF-B (Accession NM_033135). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCDGF-B. LOC199725 (Accession XM_117119) is another VGAM196 host target gene. LOC199725 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199725 BINDING SITE, designated SEQ ID:43244, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12664] Another function of VGAM196 is therefore inhibition of LOC199725 (Accession XM_117119). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC199725. LOC202459 (Accession NM_145303) is another VGAM196 host target gene. LOC202459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202459 BINDING SITE, designated SEQ ID:29816, to the nucleotide sequence of VGAM196 RNA, herein designated VGAM RNA, also designated SEQ ID:2907.

[12665] Another function of VGAM196 is therefore inhibition of LOC202459 (Accession NM_145303). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202459. LOC257048 (Accession XM_171240) is another VGAM196 host target gene. LOC257048 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257048 BINDING SITE, designated SEQ ID:46028, to the nucleotide sequence of VGAM196 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2907.

[12666] Another function of VGAM196 is therefore inhibition of LOC257048 (Accession XM_171240). Accordingly, utilities of VGAM196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257048. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 197 (VGAM197) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12667] VGAM197 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM197 was detected is described hereinabove with reference to Figs. 1–8.

[12668] VGAM197 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM197 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12669] VGAM197 gene encodes a VGAM197 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM197 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM197 precursor RNA is designated SEQ ID:183, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:183 is located at position 31769 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12670] VGAM197 precursor RNA folds onto itself, forming VGAM197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12671] An enzyme complex designated DICER COMPLEX, `dices` the VGAM197 folded precursor RNA into VGAM197 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM197 RNA is designated SEQ ID:2908, and is provided hereinbelow with reference to the sequence listing part.

[12672] VGAM197 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM197 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM197 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12673] VGAM197 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM197 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM197 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM197 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM197 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12674] The complementary binding of VGAM197 RNA, herein designated VGAM RNA, to host target binding sites on VGAM197 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM197 host target RNA into VGAM197 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12675] It is appreciated that VGAM197 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM197 host target genes. The mRNA of each one of this plurality of VGAM197 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM197 RNA, herein designated VGAM RNA, and which when bound by VGAM197 RNA causes inhibition of translation of respective one or more VGAM197 host target proteins.

[12676] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM197 gene, herein designated VGAM GENE, on one or more VGAM197 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[12677] It is yet further appreciated that a function of VGAM197 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM197 correlate with, and may be deduced from, the identity of the host target genes which VGAM197 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12678] Nucleotide sequences of the VGAM197 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM197 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM197 are further described hereinbelow with reference to Table 1.

[12679] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM197 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM197 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12680] As mentioned hereinabove with reference to Fig. 1, a function of VGAM197 gene, herein designated VGAM is inhibition of expression of VGAM197 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM197 correlate with, and may be deduced from, the identity of the target genes which VGAM197 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12681] Diaphanous Homolog 2 (Drosophila) (DIAPH2, Accession NM_006729) is a VGAM197 host target gene. DIAPH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIAPH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIAPH2 BINDING SITE, designated SEQ ID:13559, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:2908.

[12682] A function of VGAM197 is therefore inhibition of Di-

aphanous Homolog 2 (Drosophila) (DIAPH2, Accession NM_006729), a gene which may affect in oogenesis. Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIAPH2. The function of DIAPH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM129.F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM_033644) is another VGAM197 host target gene. FBXW1B BINDING SITE1 through FBXW1B BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FBXW1B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXW1B BINDING SITE1 through FBXW1B BINDING SITE3, designated SEQ ID:27368, SEQ ID:14666 and SEQ ID:27378 respectively, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:2908.

[12683] Another function of VGAM197 is therefore inhibition of F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM_033644), a gene which somehow is involved in the

process of neuronal cell differentiation or brain development. Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW1B. The function of FBXW1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Accession XM_031949) is another VGAM197 host target gene. ACTR1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACTR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTR1A BINDING SITE, designated SEQ ID:31536, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:2908.

[12684] Another function of VGAM197 is therefore inhibition of ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Accession XM_031949). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with ACTR1A. CED-6 (Accession NM_016315) is another VGAM197 host target gene. CED-6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CED-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CED-6 BINDING SITE, designated SEQ ID:18432, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:2908.

[12685] Another function of VGAM197 is therefore inhibition of CED-6 (Accession NM_016315). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CED-6. GABA(A) Receptor-associated Protein Like 1 (GABARAPL1, Accession NM_031412) is another VGAM197 host target gene. GABARAPL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GABARAPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL1 BINDING SITE, designated SEQ ID:25391, to the nucleotide sequence of

VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:2908.

[12686] Another function of VGAM197 is therefore inhibition of GABA(A) Receptor-associated Protein Like 1 (GABARAPL1, Accession NM_031412). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL1.

MGC15396 (Accession NM_052855) is another VGAM197 host target gene. MGC15396 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15396, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15396 BINDING SITE, designated SEQ ID:27438, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:2908.

[12687] Another function of VGAM197 is therefore inhibition of MGC15396 (Accession NM_052855). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15396. Pellino Homolog 1 (Drosophila) (PELI1, Accession NM_020651) is another VGAM197 host target gene.

PELI1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PELI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI1 BINDING SITE, designated SEQ ID:21817, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:2908.

[12688] Another function of VGAM197 is therefore inhibition of Pellino Homolog 1 (Drosophila) (PELI1, Accession NM_020651). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI1. LOC203411 (Accession XM_117547) is another VGAM197 host target gene. LOC203411 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203411 BINDING SITE, designated SEQ ID:43565, to the nucleotide sequence of VGAM197 RNA, herein designated VGAM RNA, also designated SEQ ID:2908.

[12689] Another function of VGAM197 is therefore inhibition of LOC203411 (Accession XM_117547). Accordingly, utilities of VGAM197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203411. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 198 (VGAM198) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12690] VGAM198 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM198 was detected is described hereinabove with reference to Figs. 1–8.

[12691] VGAM198 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM198 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12692] VGAM198 gene encodes a VGAM198 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM198

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM198 precursor RNA is designated SEQ ID:184, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:184 is located at position 194945 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12693] VGAM198 precursor RNA folds onto itself, forming VGAM198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12694] An enzyme complex designated DICER COMPLEX, `dices` the VGAM198 folded precursor RNA into VGAM198 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM198 RNA is designated SEQ ID:2909, and is provided hereinbelow with reference to the sequence listing part.

[12695] VGAM198 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM198 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM198 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12696] VGAM198 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM198 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM198 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM198 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM198 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12697] The complementary binding of VGAM198 RNA, herein designated VGAM RNA, to host target binding sites on VGAM198 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM198 host target RNA into VGAM198 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12698] It is appreciated that VGAM198 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM198 host target genes. The mRNA of

each one of this plurality of VGAM198 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM198 RNA, herein designated VGAM RNA, and which when bound by VGAM198 RNA causes inhibition of translation of respective one or more VGAM198 host target proteins.

[12699] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM198 gene, herein designated VGAM GENE, on one or more VGAM198 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[12700] It is yet further appreciated that a function of VGAM198 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM198 correlate with, and may be deduced from, the identity of the host target genes which VGAM198 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12701] Nucleotide sequences of the VGAM198 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM198 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM198 are further described hereinbelow with reference to Table 1.

[12702] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM198 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM198 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12703] As mentioned hereinabove with reference to Fig. 1, a function of VGAM198 gene, herein designated VGAM is inhibition of expression of VGAM198 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM198 correlate with, and may be deduced from, the identity of the target genes which VGAM198 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12704] FLJ23516 (Accession NM_024539) is a VGAM198 host target gene. FLJ23516 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23516 BINDING SITE, designated SEQ ID:23747, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:2909.

[12705] A function of VGAM198 is therefore inhibition of FLJ23516 (Accession NM_024539). Accordingly, utilities of

VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23516. LOC148189 (Accession XM_086087) is another VGAM198 host target gene. LOC148189 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148189 BINDING SITE, designated SEQ ID:38483, to the nucleotide sequence of VGAM198 RNA, herein designated VGAM RNA, also designated SEQ ID:2909.

[12706] Another function of VGAM198 is therefore inhibition of LOC148189 (Accession XM_086087). Accordingly, utilities of VGAM198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148189. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 199 (VGAM199) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12707] VGAM199 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM199 was detected is described hereinabove with reference to Figs. 1–8.

[12708] VGAM199 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM199 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12709] VGAM199 gene encodes a VGAM199 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM199 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM199 precursor RNA is designated SEQ ID:185, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:185 is located at position 121113 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12710] VGAM199 precursor RNA folds onto itself, forming VGAM199 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[12711] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM199 folded precursor RNA into VGAM199 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 43%) nucleotide se-
quence of VGAM199 RNA is designated SEQ ID:2910, and
is provided hereinbelow with reference to the sequence
listing part.

[12712] VGAM199 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM199 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM199 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[12713] VGAM199 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM199 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM199 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM199 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM199 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[12714] The complementary binding of VGAM199 RNA, herein designated VGAM RNA, to host target binding sites on VGAM199 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM199 host target RNA into VGAM199 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12715] It is appreciated that VGAM199 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM199 host target genes. The mRNA of each one of this plurality of VGAM199 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM199 RNA, herein designated VGAM RNA, and which when bound by VGAM199 RNA causes inhibition of translation of respective one or more VGAM199 host target proteins.

[12716] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM199 gene, herein designated VGAM GENE, on one or

more VGAM199 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12717] It is yet further appreciated that a function of VGAM199 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM199 correlate with, and may be deduced from, the identity of the host target genes which VGAM199 binds and inhibits, and the function of these host target genes, as elaborated herein-

below.

- [12718] Nucleotide sequences of the VGAM199 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM199 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM199 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM199 are further described hereinbelow with reference to Table 1.
- [12719] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM199 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM199 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [12720] As mentioned hereinabove with reference to Fig. 1, a function of VGAM199 gene, herein designated VGAM is inhibition of expression of VGAM199 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM199 correlate with, and may be deduced from, the identity of the target genes which VGAM199 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12721] Catalase (CAT, Accession NM_001752) is a VGAM199 host target gene. CAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAT BINDING SITE, designated SEQ ID:7487, to the nucleotide sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:2910.

[12722] A function of VGAM199 is therefore inhibition of Catalase (CAT, Accession NM_001752). Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAT. FLJ11101 (Accession NM_018322) is another VGAM199 host target gene. FLJ11101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11101 BINDING SITE, designated SEQ ID:20313, to the nucleotide sequence of VGAM199 RNA, herein designated VGAM RNA, also designated SEQ ID:2910.

- [12723] Another function of VGAM199 is therefore inhibition of FLJ11101 (Accession NM_018322). Accordingly, utilities of VGAM199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11101. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 200 (VGAM200) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [12724] VGAM200 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM200 was detected is described hereinabove with reference to Figs. 1–8.
- [12725] VGAM200 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM200 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [12726] VGAM200 gene encodes a VGAM200 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM200 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM200 precursor RNA is designated SEQ ID:186, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:186 is located at position 92234 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12727] VGAM200 precursor RNA folds onto itself, forming VGAM200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12728] An enzyme complex designated DICER COMPLEX, `dices` the VGAM200 folded precursor RNA into VGAM200 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 59%) nucleotide sequence of VGAM200 RNA is designated SEQ ID:2911, and is provided hereinbelow with reference to the sequence listing part.

[12729] VGAM200 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM200 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM200 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12730] VGAM200 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM200 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM200 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM200 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM200 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12731] The complementary binding of VGAM200 RNA, herein designated VGAM RNA, to host target binding sites on VGAM200 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM200 host target RNA into VGAM200 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12732] It is appreciated that VGAM200 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM200 host target genes. The mRNA of each one of this plurality of VGAM200 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM200 RNA, herein designated VGAM RNA, and which when bound by VGAM200 RNA causes inhibition of translation of respective one or more VGAM200 host target proteins.

[12733] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM200 gene, herein designated VGAM GENE, on one or more VGAM200 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12734] It is yet further appreciated that a function of VGAM200 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM200 correlate with, and may be deduced from, the identity of the host target genes which VGAM200 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12735] Nucleotide sequences of the VGAM200 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM200 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM200 are further described hereinbelow with reference to Table 1.

[12736] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM200 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM200 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[12737] As mentioned hereinabove with reference to Fig. 1, a function of VGAM200 gene, herein designated VGAM is inhibition of expression of VGAM200 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM200 correlate with, and may be deduced from, the identity of the target genes which VGAM200 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12738] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 4 (B4GALT4, Accession NM_003778) is a VGAM200 host target gene. B4GALT4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT4 BINDING SITE, designated SEQ ID:9861, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12739] A function of VGAM200 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypep-

tide 4 (B4GALT4, Accession NM_003778). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT4. Chromosome 14 Open Reading Frame 1 (C14orf1, Accession NM_007176) is another VGAM200 host target gene. C14orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C14orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C14orf1 BINDING SITE, designated SEQ ID:14028, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12740] Another function of VGAM200 is therefore inhibition of Chromosome 14 Open Reading Frame 1 (C14orf1, Accession NM_007176). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf1. Epidermal Growth Factor (beta-urogastrone) (EGF, Accession NM_001963) is another VGAM200 host target gene. EGF BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGF, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGF BINDING SITE, designated SEQ ID:7689, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12741] Another function of VGAM200 is therefore inhibition of Epidermal Growth Factor (beta-urogastrone) (EGF, Accession NM_001963), a gene which stimulates the growth of epidermal and epithelial tissues and of some fibroblasts in cell culture. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGF. The function of EGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Follistatin-like 3 (secreted glycoprotein) (FSTL3, Accession NM_005860) is another VGAM200 host target gene. FSTL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FSTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of FSTL3 BINDING SITE, designated SEQ ID:12473, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12742] Another function of VGAM200 is therefore inhibition of Follistatin-like 3 (secreted glycoprotein) (FSTL3, Accession NM_005860), a gene which is a member of the follistatin-module-protein family. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FSTL3. The function of FSTL3 has been established by previous studies. Follistatin-like-3 (FSTL3) is a member of the follistatin-module protein family, which is composed of extracellular matrix-associated glycoproteins thought to act in a paracrine manner to bind morphogens or growth/differentiation factors and regulate their activity during development (Hayette et al., 1998). In addition to the t(11;19) translocation in a case of B-cell chronic lymphocytic leukemia from which FSTL3 was isolated, Hayette et al. (1998) also observed rearrangement of the FSTL3 gene in a case of B-cell non-Hodgkin lymphoma (NHL; 605027) and in a case of B-cell mantle zone lymphoma, suggesting that FSTL3 may be involved in the leukemogenesis process.

[12743] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12744] Hayette, S.; Gadoux, M.; Martel, S.; Bertrand, S.; Tigaud, I.; Magaud, J.-P.; Rimokh, R. : FLRG (follistatin-related gene), a new target of chromosomal rearrangement in malignant blood disorders. *Oncogene* 16: 2949–2954, 1998. ; and

[12745] Rimokh, R.; Berger, F.; Delsol, G.; Charrin, C.; Bertheas, M. F.; Ffrench, M.; Garoscio, M.; Felman, P.; Coiffier, C.; Bryon, P. A. : Rearrangement and overexpression of the BCL-1/PRAD-1.

[12746] Further studies establishing the function and utilities of FSTL3 are found in John Hopkins OMIM database record ID 605343, and in cited publications numbered 4423, 545 and 4906 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 1 Receptor Antagonist (IL1RN, Accession NM_000577) is another VGAM200 host target gene. IL1RN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL1RN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

IL1RN BINDING SITE, designated SEQ ID:6179, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12747] Another function of VGAM200 is therefore inhibition of Interleukin 1 Receptor Antagonist (IL1RN, Accession NM_000577), a gene which inhibits the activity of il-1 by binding to its receptor. il-1ra has no il-1 like activity. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RN. The function of IL1RN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193. Insulin Receptor (INSR, Accession XM_048346) is another VGAM200 host target gene. INSR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INSR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INSR BINDING SITE, designated SEQ ID:35154, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12748] Another function of VGAM200 is therefore inhibition of Insulin Receptor (INSR, Accession XM_048346), a gene which binds insulin and has a tyrosine–protein kinase activity. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INSR. The function of INSR has been established by previous studies. The insulin (INS; 176730) receptor is a tetramer of 2 alpha and 2 beta subunits. The alpha and beta subunits are coded by a single gene and are joined by disulfide bonds, a mechanism parallel to that of the ligand, insulin (Rubin, 1984). Mutation in either the structural gene or some of the processing steps may lead to insulin resistance. Ullrich et al. (1985) deduced the entire 1,370–amino acid sequence from a cDNA clone. The precursor starts with a 27–amino acid signal sequence, followed by the receptor alpha subunit, a precursor processing enzyme cleavage site, then the beta subunit containing a single 23–amino acid transmembrane sequence. Seino et al. (1989) found that the INSR gene spans more than 120 kb and has 22 exons. All introns interrupt protein coding regions of the gene. The 11 exons encoding the alpha subunit are dispersed over more than 90 kb, whereas the 11 exons encoding the beta subunit

are located together in a region of about 30 kb. Three transcriptional initiation sites were identified, located 276, 282, and 283 bp upstream of the translation initiation site. There is heterogeneity of insulin receptors in different tissues Leibiger et al. (2001) showed that insulin activates the transcription of its own gene and that of the beta-cell glucokinase gene (GCK; 138079) by different mechanisms. Whereas INS gene transcription is promoted by signaling through INSR type A (without exon 11), phosphatidylinositol 3-kinase (PI3K) class IA (see OMIM Ref. No. 171833), and the 70-kD S6 kinase, insulin stimulates the beta-cell GCK gene by signaling via INSR type B (with exon 11), PI3K class II (see OMIM Ref. No. 602838)-like activity, and protein kinase B (OMIM Ref. No. 164730). These data provided evidence for selectivity in insulin action via the 2 INSR isoforms, the molecular basis being preferential signaling through different PI3K and protein kinases. Using a yeast 2-hybrid system, Dey et al. (1998) identified a regulatory subunit of PI3K, PIK3R3 (OMIM Ref. No. 606076), as a binding partner of INSR. They concluded that PIK3R3 interacts with IGF1R (OMIM Ref. No. 147370) and INSR in a kinase-dependent manner, providing an alternative pathway for the activation of PI3K by

these 2 receptors. Rajala and Anderson (2001) sought to identify the tyrosine–phosphorylated protein(s) in the bovine rod outer segments (ROS) that are associated with PI3K. They concluded that tyrosine phosphorylation of the beta subunit of the insulin receptor is involved in the regulation of PI3K activity in the ROS. Animal model experiments lend further support to the function of INSR. Belke et al. (2002) generated mice with a cardiomyocyte–specific insulin receptor knockout (CIRKO), using cre/loxP recombination. Hearts of CIRKO mice were 20 to 30% smaller because of decreased postnatal hypertrophy of cardiomyocytes; they had persistent expression of the fetal beta–myosin heavy chain isoform, approximately half the normal expression of glucose transporter–1 (GLUT1; 138140), and a 2–fold increase in GLUT4 expression. Cardiac glucose uptake was increased in vivo, glycolysis was increased in isolated working hearts, and there was reduced expression of enzymes that catalyze mitochondrial beta–oxidation, leading to decreased fatty acid oxidation rates.

[12749] It is appreciated that the abovementioned animal model for INSR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre–

ciated from the publications sited hereinbelow.

[12750] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12751] Leibiger, B.; Leibiger, I. B.; Moede, T.; Kemper, S.; Kulkarni, R. N.; Kahn, C. R.; de Vargas, L. M.; Berggren, P.-O. : Selective insulin signaling through A and B insulin receptors regulates transcription of insulin and glucokinase genes in pancreatic beta cells. *Molec. Cell* 7: 559–570, 2001. ; and

[12752] Belke, D. D.; Betuing, S.; Tuttle, M. J.; Gravelleau, C.; Young, M. E.; Pham, M.; Zhang, D.; Cooksey, R. C.; McClain, D. A.; Litwin, S. E.; Taegtmeyer, H.; Severson, D.; Kahn, C. R.; Abe.

[12753] Further studies establishing the function and utilities of INSR are found in John Hopkins OMIM database record ID 147670, and in sited publications numbered 129, 11700–11706, 11709–11708, 11710–11711, 3941–3945, 11278–3967, 11442–11443, 1210, 2612–2639, 12698, 3190, 3192–319 and 4710–3209 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function-associated

Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM_002209) is another VGAM200 host target gene. ITGAL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGAL BINDING SITE, designated SEQ ID:7973, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12754] Another function of VGAM200 is therefore inhibition of Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function-associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM_002209), a gene which is a receptor for icam1, icam2, icam3 and icam4. It is involved in a variety of immune phenomena including leukocyte-endothelial cell interaction, cytotoxic t-cell mediated killing, and antibody dependent killing by granulocytes and monocytes. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAL. The function of ITGAL has been established by previous studies. See 120980 and 151510. Lymphocyte function-associated antigen-1 (LFA-1) shares

a beta subunit (see OMIM Ref. No. 116920) with other members of a family of leukocyte surface membrane antigens but has a unique alpha subunit (Sanchez-Madrid et al., 1983). LFA-1 is expressed on lymphocytes and phagocytic cells. The LFA-1 molecule is involved in the adhesion of cytotoxic T cells to their target cells. Patients with LFA-1 immunodeficiency disease (see OMIM Ref. No. 116920) have recurrent life-threatening infections, show deficiency of the beta chain of all 3 molecules, LFA-1, Mac-1 (macrophage antigen-1), and p150,95, and display profound defects in adhesion-dependent granulocyte, monocyte, and B- and T-lymphocyte functions. The alpha subunits were designated by Marlin et al. (1986) as alpha-L for LFA-1, alpha-M for Mac-1, and alpha-X for p150,95. Lu and Cyster (2002) studied the mechanisms that control localization of marginal zone B cells. They demonstrated that marginal zone B cells express elevated levels of the integrins LFA-1 and alpha-4-beta-1 (see OMIM Ref. No. 192975 and 135630) and that the marginal zone B cells bind to the ligands ICAM1 (OMIM Ref. No. 147840) and VCAM1 (OMIM Ref. No. 192225). These ligands are expressed within the marginal zone in a lymphotoxin-dependent manner. Combined inhibition of LFA-1 and alpha-

4-beta-1 causes a rapid and selective release of B cells from the marginal zone. Furthermore, lipopolysaccharide-triggered marginal zone B cell relocalization involves down-regulation of integrin-mediated adhesion. Lu and Cyster (2002) concluded that their studies identified key requirements for marginal zone B cell localization and established a role for integrins in peripheral lymphoid tissue compartmentalization

[12755] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12756] Lu, T. T.; Cyster, J. G. : Integrin-mediated long-term B cell retention in the splenic marginal zone. Science 297: 409-412, 2002. ; and

[12758] Further studies establishing the function and utilities of ITGAL are found in John Hopkins OMIM database record ID 153370, and in cited publications numbered 4962, 4964, 3348, 354 and 3556 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence. Jagged 2 (JAG2, Accession NM_002226) is another VGAM200 host target gene. JAG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAG2 BINDING SITE, designated SEQ ID:8006, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12759] Another function of VGAM200 is therefore inhibition of Jagged 2 (JAG2, Accession NM_002226), a gene which is a putative notch ligand involved in the mediation of notch signaling. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAG2. The function of JAG2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM136. Junctional Adhesion Molecule 3 (JAM3, Accession NM_032801) is another VGAM200 host target gene. JAM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JAM3,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM3 BINDING SITE, designated SEQ ID:26553, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12760] Another function of VGAM200 is therefore inhibition of Junctional Adhesion Molecule 3 (JAM3, Accession NM_032801), a gene which is a member of the junctional adhesion molecule protein family. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM3. The function of JAM3 has been established by previous studies. JAM3 is a member of the junctional adhesion molecule (JAM) family. The first identified member of the JAM family, JAM1 (OMIM Ref. No. 605721), is an immunoglobulin (Ig)-like molecule that colocalizes with tight junctions in endothelium and epithelium and is also found on blood leukocytes and platelets. Adhesion proteins targeted to cell-cell borders, like JAM1, are ideally situated to participate in leukocyte emigration. By searching an EST database for sequences similar to JAM2 (OMIM Ref. No. 606870), followed by amplification of a fetal brain cDNA library, Ar-

rate et al. (2001) isolated a cDNA encoding JAM3. The deduced 310-amino acid protein is more than 30% identical to JAM2 and JAM1. It possesses a signal sequence; 2 Ig-like folds, one a V type and the other a C2 type, containing 6 cysteines; 2 potential N-glycosylation sites; and a 46-amino acid intracellular tail with a C-terminal binding motif for PDZ domains and a phosphorylation site. Northern blot analysis revealed wide expression of an approximately 3.3-kb transcript, with highest levels in placenta, brain, and kidney. Expression was also detected in cultured endothelial cells. Binding analysis showed that unlike JAM2, JAM3 is unable to adhere to leukocyte cell lines and only forms weak homotypic interactions. However, JAM3 was found to interact strongly with JAM2. RT-PCR and flow cytometric analyses detected strong expression in cytotoxic T-cell lines and activated T lymphocytes, but not in resting cells. Immunoprecipitation analysis indicated that the 43-kD JAM3 protein binds with JAM2. While studying JAM2 with immunoprecipitation analysis, Liang et al. (2002) identified a 40-kD protein and subsequently cloned JAM3. Western blot analysis showed expression on natural killer cells. Liang et al. (2002) proposed that JAM3 is a functional JAM2 receptor.

[12761] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12762] Arrate, M. P.; Rodriguez, J. M.; Tran, T. T.; Brock, T. A.; Cunningham, S. A. : Cloning of human junctional adhesion molecule 3 (JAM3) and its identification as the JAM2 counter-receptor. J. Biol. Chem. 276: 45826–45832, 2001. ; and

[12763] Liang, T. W.; Chiu, H. H.; Gurney, A.; Sidle, A.; Tumas, D. B.; Schow, P.; Foster, J.; Klassen, T.; Dennis, K.; DeMarco, R. A.; Pham, T.; Frantz, G.; Fong, S. : Vascular endothelial-jun.

[12764] Further studies establishing the function and utilities of JAM3 are found in John Hopkins OMIM database record ID 606871, and in cited publications numbered 5392 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lymphoid Enhancer-binding Factor 1 (LEF1, Accession NM_016269) is another VGAM200 host target gene. LEF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LEF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LEF1 BINDING SITE, designated SEQ ID:18392, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12765] Another function of VGAM200 is therefore inhibition of Lymphoid Enhancer-binding Factor 1 (LEF1, Accession NM_016269), a gene which plays an essential role in the formation of several organs and structures that require inductive tissue interactions. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEF1. The function of LEF1 has been established by previous studies. Lymphoid enhancer-binding factor-1 (LEF1) is a 48-kD nuclear protein that is expressed in pre-B and T cells. It binds to a functionally important site in the T-cell receptor-alpha (TCRA; 186880) enhancer and confers maximal enhancer activity. LEF1 belongs to a family of regulatory proteins that share homology with high mobility group protein-1 (HMG1; 163905). Animal model experiments lend further support to the function of LEF1. Lef1 is a sequence-specific DNA-binding protein that is expressed in pre-B and T lymphocytes of adult mice, and in the neural crest, mesencephalon, tooth germs, whisker follicles, and

other sites during mouse embryogenesis. Van Genderen et al. (1994) generated mice carrying a homozygous germline mutation in the Lef1 gene that eliminated Lef1 protein expression and caused postnatal lethality. The mutant mice lacked teeth, mammary glands, whiskers, and hair, although they developed rudimentary hair follicles. The Lef1-deficient mice also lacked the mesencephalic nucleus of the trigeminal nerve, the only neural crest-derived neuronal populations. The mutant mice showed no obvious defects in lymphoid cell populations at birth. Van Genderen et al. (1994) suggested that Lef1 plays an essential role in the formation of several organs and structures that require inductive tissue interactions

[12766] It is appreciated that the abovementioned animal model for LEF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[12767] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12768] van Genderen, C.; Okamura, R. M.; Farinas, I.; Quo, R. G.; Parslow, T. G.; Bruhn, L.; Grosschedl, R. : Development of several organs that require inductive epithelial-mes-

enchymal interactions is impaired in LEF-1-deficient mice.

[12769] de Lau, W.; Clevers, H. : LEF1 turns over a new leaf. Nature Genet. 28: 3-5, 2001.

[12770] Further studies establishing the function and utilities of LEF1 are found in John Hopkins OMIM database record ID 153245, and in cited publications numbered 11514-11521 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myosin IE (MYO1E, Accession NM_004998) is another VGAM200 host target gene. MYO1E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MYO1E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO1E BINDING SITE, designated SEQ ID:11442, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12771] Another function of VGAM200 is therefore inhibition of Myosin IE (MYO1E, Accession NM_004998), a gene which is an unconventional myosin. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with MYO1E. The function of MYO1E has been established by previous studies. Bement et al. (1994) cloned a human unconventional myosin gene, MYO1E, encoding a predicted 127-kD polypeptide of 1,109 amino acids. The gene, which they designated myosin IC, contains a characteristic N-terminal myosin head, a single 'IQ motif' predicted to bind a single myosin light chain, and a C-terminal tail with a putative membrane-binding site. They also noted the presence of a C-terminal src-homology domain, reminiscent of 'long-tailed' myosins I from amoeboid organisms. By Northern analysis, Bement et al. (1994) detected ubiquitous expression of MYO1E. Hasson et al. (1996) used fluorescence in situ hybridization to map the loci for 4 unconventional myosin loci in humans: MYO1E (formerly MYO1C), MYO1A (OMIM Ref. No. 601478), MYO1F (OMIM Ref. No. 601480), and MYO10 (OMIM Ref. No. 601481). The MYO1E gene was found to be located on 15q21-q22 in the precise location predicted from its location on chromosome 9 of the mouse.

[12772] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [12773] Bement, W. M.; Wirth, J. A.; Mooseker, M. S. : Cloning and mRNA expression of human unconventional myosin-IC: a homologue of amoeboid myosins-I with a single IQ motif and an SH3 domain. J. Molec. Biol. 243: 356-363, 1994. ; and
- [12774] Hasson, T.; Skowron, J. F.; Gilbert, D. J.; Avraham, K. B.; Perry, W. L.; Bement, W. M.; Anderson, B. L.; Sherr, E. H.; Chen, Z.-Y.; Greene, L. A.; Ward, D. C.; Corey, D. P.; Mooseker.
- [12775] Further studies establishing the function and utilities of MYO1E are found in John Hopkins OMIM database record ID 601479, and in cited publications numbered 651 and 7027 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM_002531) is another VGAM200 host target gene. NTSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NTSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTSR1 BINDING SITE, designated SEQ ID:8372, to the nucleotide sequence of VGAM200 RNA, herein designated

VGAM RNA, also designated SEQ ID:2911.

[12776] Another function of VGAM200 is therefore inhibition of Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM_002531), a gene which is associated with g proteins that activate a phosphatidylinositol– calcium second messenger system. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTSR1. The function of NTSR1 has been established by previous studies. The tridecapeptide neurotensin (OMIM Ref. No. 162650) is widely distributed in various regions of the brain and in peripheral tissues. In the brain, neurotensin acts as a neuromodulator, in particular of dopamine transmission in the nigrostriatal and mesocorticolimbic systems, suggesting its possible implication in dopamine-associated behavioral neurodegenerative and neuropsychiatric disorders. Its various effects are mediated by specific membrane receptors. Vita et al. (1993) isolated a cDNA encoding a human neurotensin receptor (NTSR1) and showed that it predicts a 418–amino acid protein that shares 84% homology with the rat protein. Le et al. (1997) also cloned human NTSR1 cDNA and its genomic DNA. The gene contains 4 exons and spans more than 10 kb. The authors

identified a highly polymorphic tetranucleotide repeat approximately 3 kb from the gene. Southern blot analysis revealed that the NTSR1 gene is present in the human genome as a single-copy gene. Le et al. (1997) stated that the neurotensin receptor has 7 transmembrane spanning regions and high homology to other receptors that couple to G proteins. Vincent (1995) reviewed pharmacologic and molecular data suggesting the existence of other types of functional neurotensin receptors.

[12777] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12778] Le, F.; Groshan, K.; Zeng, X. P.; Richelson, E. : Characterization of the genomic structure, promoter region, and a tetranucleotide repeat polymorphism of the human neurotensin receptor gene. J. Biol. Chem. 272: 1315–1322, 1997. ; and

[12779] Vincent, J.–P. : Neurotensin receptors: binding properties, transduction pathways, and structure. Cell. Molec. Neurobiol. 15: 501–512, 1995.

[12780] Further studies establishing the function and utilities of NTSR1 are found in John Hopkins OMIM database record ID 162651, and in cited publications numbered

5197–5200 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430) is another VGAM200 host target gene. PAFAH1B1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAFAH1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAFAH1B1 BINDING SITE, designated SEQ ID:6013, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12781] Another function of VGAM200 is therefore inhibition of Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAFAH1B1. Pyruvate Dehydrogenase Kinase, Isoenzyme 4 (PDK4, Accession NM_002612) is another VGAM200 host target gene. PDK4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by PDK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDK4 BINDING SITE, designated SEQ ID:8477, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12782] Another function of VGAM200 is therefore inhibition of Pyruvate Dehydrogenase Kinase, Isoenzyme 4 (PDK4, Accession NM_002612). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDK4. Phosphatidylinositol 4-kinase, Catalytic, Beta Polypeptide (PIK4CB, Accession NM_002651) is another VGAM200 host target gene. PIK4CB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK4CB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK4CB BINDING SITE, designated SEQ ID:8513, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12783] Another function of VGAM200 is therefore inhibition of Phosphatidylinositol 4-kinase, Catalytic, Beta Polypeptide (PIK4CB, Accession NM_002651), a gene which phosphorylates the 4-OH position of phosphatidyl inositol. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK4CB. The function of PIK4CB has been established by previous studies. By degenerate PCR, library screening, and 5-prime-RACE, Meyers and Cantley (1997) cloned human placenta and heart cDNAs encoding a novel PI 4-kinase, which they called PI4K-beta. The predicted 801-amino acid PI4K-beta protein contains an N-terminal lipid kinase unique domain, which is shared by members of both the PI 3-kinase (e.g., 171834) and PI 4-kinase families, and a C-terminal catalytic domain, which defines this protein as a member of a much larger protein/lipid kinase family. PI4K-beta shares significant amino acid sequence similarity with yeast PIK1. Western blot analysis of mammalian cell lysates using an antibody against PI4K-beta detected a 110-kD protein. Northern blot analysis showed that PI4K-beta is ubiquitously expressed as an approximately 4-kb transcript, with highest expression in heart, pancreas, and skeletal muscle. Biochemical anal-

yses indicated that PI4K-beta is a type III enzyme that is sensitive to wortmannin. Meyers and Cantley (1997) stated that PI4K-beta is likely the wortmannin-sensitive PI 4-kinase described by Nakanishi et al. (1995) that is responsible for regulating the synthesis of agonist-sensitive pools of polyphosphoinositides. Saito et al. (1997) isolated a PI 4-kinase cDNA from a human adult brain cDNA library. The sequence of the cDNA was highly identical to that of the PI4K-beta cDNA (Meyers and Cantley, 1997), and Saito et al. (1997) suggested that they represented alternative products of the same gene. Suzuki et al. (1997) cloned 3 forms of cDNAs encoding human PIK4CB, which they named NPIK for 'novel putative phosphatidylinositol kinase;' 2 of the cDNAs had different 5-prime open reading frame sequences, and the third contained a 45-bp insertion within the coding sequence. The authors suggested that these cDNAs resulted from alternative transcription initiation sites and alternative splicing. By Northern blot analysis, they detected 4.8- and 3.6-kb transcripts whose relative levels varied in different tissues. Using the green fluorescent protein system, they demonstrated that PIK4CB is localized in the cytoplasm.

[12784] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [12785] Saito, T.; Seki, N.; Ishii, H.; Ohira, M.; Hayashi, A.; Kozuma, S.; Hori, T. : Complementary DNA cloning and chromosomal mapping of a novel phosphatidylinositol kinase gene. DNA Res. 4: 301–305, 1997. ; and

- [12787] Further studies establishing the function and utilities of PIK4CB are found in John Hopkins OMIM database record ID 602758, and in cited publications numbered 5889–5892 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pleckstrin (PLEK, Accession NM_002664) is another VGAM200 host target gene. PLEK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLEK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLEK BINDING SITE, designated SEQ ID:8533, to the nucleotide sequence of VGAM200 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:2911.

[12788] Another function of VGAM200 is therefore inhibition of Pleckstrin (PLEK, Accession NM_002664), a gene which is the major protein kinase c substrate of platelets. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLEK. The function of PLEK has been established by previous studies. In platelets, agonists that stimulate phosphoinositide turnover cause the rapid phosphorylation of a protein of apparent relative molecular mass 40,000–47,000, called P47, by protein kinase C. Tyers et al. (1988) isolated human P47 clones by immunologic screening of a lambda-gt11 cDNA library from a promyelocytic leukemia cell line. A 1,050 basepair open reading frame that could encode the protein in question was confirmed by comparison with peptide sequences from platelet P47 and by expression of the putative P47 in *E. coli* and in vitro. The P47 sequence appeared to have been conserved throughout vertebrate evolution and was not similar to any other known sequence, including lipocortin (OMIM Ref. No. 151690). Based on its specific expression in platelets and various differentiated white blood cells, Tyers et al. (1988) proposed the name pleckstrin for

platelet and leukocyte C kinase substrate and for the KSTR string of amino acids in the sequence KFARKSTRRSIR, the probable phosphorylation site. Tyers et al. (1989) re-reported the pleckstrin sequence. They deduced a molecular weight of 40,087. By differential display comparison of murine epidermal promotion-sensitive and -resistant cell lines after exposure to a tumor promoter, phorbol ester TPA, Cmarik et al. (2000) observed preferential expression in promotion-resistant cells of a cDNA encoding Plek. Northern blot analysis detected a 3.6-kb Plek transcript in mouse heart, lung, and spleen. Mouse Plek shares 91% amino acid identity with human PLEK. Using an interspecific backcross panel, Cmarik et al. (2000) mapped the mouse Plek gene to the proximal part of chromosome 11 in a region showing homology of synteny to human 2p, where they stated the PLEK gene has been mapped.

[12789] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12790] Cmarik, J. L.; Hegamyer, G.; Gerrard, B.; Dean, M.; Colburn, N. H. : cDNA cloning and mapping of mouse pleckstrin (Plek), a gene upregulated in transformation-resistant cells. *Genomics* 66: 204-212, 2000. ; and

[12791] Tyers, M.; Haslam, R. J.; Rachubinski, R. A.; Harley, C. B. : Molecular analysis of pleckstrin: the major protein kinase C substrate of platelets. J. Cell. Biochem. 40: 133–145, 1989.

[12792] Further studies establishing the function and utilities of PLEK are found in John Hopkins OMIM database record ID 173570, and in cited publications numbered 1195–1197 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Parathymosin (PTMS, Accession NM_002824) is another VGAM200 host target gene. PTMS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTMS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTMS BINDING SITE, designated SEQ ID:8696, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12793] Another function of VGAM200 is therefore inhibition of Parathymosin (PTMS, Accession NM_002824), a gene which is involved in the regulation of cellular immunity. Accordingly, utilities of VGAM200 include diagnosis, pre–

vention and treatment of diseases and clinical conditions associated with PTMS. The function of PTMS has been established by previous studies. Parathymosin is a polypeptide similar in size and amino acid composition to prothymosin- α (OMIM Ref. No. 188390). It has a high content of dicarboxylic amino acids and a complete absence of aromatic and sulfur-containing amino acids. It has 101 amino acid residues as compared to 111 for prothymosin. Clinton et al. (1989) reported the isolation of a cDNA clone for human kidney parathymosin containing the complete coding region and extending into the 5-prime and 3-prime flanking sequences. The open reading frame contains 306 nucleotides, including the codon for the initiator methionine. Analysis of the 5-prime flanking sequence excluded the presence of a hydrophobic signal peptide in the translated sequence. This permitted the conclusion that parathymosin, like prothymosin- α , is synthesized without formation of a larger precursor polypeptide. Parathymosin and prothymosin show a reciprocal relationship: the highest levels of parathymosin and its mRNA are present in liver, kidney, and brain (with lowest levels in thymus and spleen), whereas prothymosin- α and its mRNA are present in highest concentrations in

thymus and spleen (with lower levels in kidney, brain, and liver). By in situ hybridization of rat parathymosin cDNA to human metaphase chromosomes, Szabo et al. (1989) localized the gene for human parathymosin to 17q12-q22.

[12794] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12795] Clinton, M.; Frangou-Lazaridis, M.; Panneerselvam, C.; Horecker, B. L. : The sequence of human parathymosin deduced from a cloned human kidney cDNA. Biochem. Biophys. Res. Commun. 158: 855-862, 1989. ; and

[12796] Szabo, P.; Clinton, M.; Macera, M.; Horecker, B. L. : Localization of the gene coding for parathymosin to chromosome 17 in humans. Cytogenet. Cell Genet. 50: 91-92, 1989.

[12797] Further studies establishing the function and utilities of PTMS are found in John Hopkins OMIM database record ID 168440, and in cited publications numbered 2387-2388 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAS Guanyl Releasing Protein 1 (calcium and DAG-regulated) (RASGRP1, Accession NM_005739) is another VGAM200 host target gene. RASGRP1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by RASGRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASGRP1 BINDING SITE, designated SEQ ID:12303, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12798] Another function of VGAM200 is therefore inhibition of RAS Guanyl Releasing Protein 1 (calcium and DAG-regulated) (RASGRP1, Accession NM_005739). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP1. Regenerating Islet-derived-like, Pancreatic Stone Protein-like, Pancreatic Thread Protein-like (rat) (REGL, Accession NM_006508) is another VGAM200 host target gene. REGL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by REGL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REGL BINDING SITE, designated SEQ ID:13257, to the nucleotide sequence of VGAM200

RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12799] Another function of VGAM200 is therefore inhibition of Regenerating Islet–derived–like, Pancreatic Stone Protein–like, Pancreatic Thread Protein–like (rat) (REGL, Accession NM_006508), a gene which is a member of REG family with unknown function. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REGL. The function of REGL has been established by previous studies. The REG1A (OMIM Ref. No. 167770) and REG1B genes belong to the type I subclass of the REG family of genes, each of which encodes a 166–amino acid protein. Moriizumi et al. (1994) and Gharib et al. (1993) mapped the REG1A and REG1B genes to 2p12. Miyashita et al. (1995) demonstrated that 4 REG family genes are tandemly ordered in a 95–kb DNA region of 2p12. From analysis of YAC clones containing the 4 genes using 2–color fluorescence in situ hybridization, they demonstrated the following order: 2cen--PAP--RS--REG1A--REG1B--ptel. (RS, so designated for REG–related sequence, shows a high degree of homology to the REG1 genes but has an in–frame stop codon in the protein coding region.)

[12800] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12801] Miyashita, H.; Nakagawara, K.; Mori, M.; Narushima, Y.; Noguchi, N.; Moriizumi, S.; Takasawa, S.; Yonekura, H.; Takeuchi, T.; Okamoto, H. : Human REG family genes are tandemly ordered in a 95-kilobase region of chromosome 2p12. FEBS Lett. 377: 429–433, 1995. ; and

[12802] Moriizumi, S.; Watanabe, T.; Unno, M.; Nakagawara, K.; Suzuki, Y.; Miyashita, H.; Yonekura, H.; Okamoto, H. : Iso-lation, structural determination and expression of a novel reg gene, hum.

[12803] Further studies establishing the function and utilities of REGL are found in John Hopkins OMIM database record ID 167771, and in cited publications numbered 10915, 1091 and 10925 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Selectin P Ligand (SELPLG, Accession XM_006867) is another VGAM200 host target gene. SELPLG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SELPLG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of SELPLG BINDING SITE, designated SEQ ID:30020, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12804] Another function of VGAM200 is therefore inhibition of Selectin P Ligand (SELPLG, Accession XM_006867), a gene which binds to p-, e- and l-selectins, which mediates the tethering and rolling of neutrophils and t-lymphocytes on endothelial cells. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELPLG. The function of SELPLG has been established by previous studies. Human granulocyte ehrlichiosis (HGE) is a febrile tick-bone illness caused by an intracellular bacterium remarkable for its tropism for professionally phagocytic neutrophils. Herron et al. (2000) demonstrated that monoclonal antibodies against the P-selectin binding domain of the leukocyte P-selectin glycoprotein ligand PSGL1 prevented HGE cell binding and infection, as did enzymatic digestion of PSGL1. Furthermore, simultaneous neoexpression in non-susceptible cells of complementary DNAs for both PSGL1 and its modifying alpha-(1,3) fucosyltransferase, Fuc-TVII (FUT7), allowed binding and infection by HGE. Thus, the

HGE bacterium specifically bound to fucosylated leukocyte PSGL1. Selection mimicry is likely central to the organism's unique ability to target and infect neutrophils. Selectin P ligand, or P-selectin glycoprotein ligand (OMIM Ref. No. PSGL-1), is the high affinity counter-receptor for P-selectin (SELP; 173610) on myeloid cells and stimulated T lymphocytes. As such, it plays a critical role in the tethering of these cells to activated platelets or endothelia expressing P-selectin. Veldman et al. (1995) cloned the SELPLG gene from a human placenta genomic DNA library and showed that a single intron of approximately 9 kb is located in the 5-prime untranslated region and that the complete coding region resides in exon 2. The organization of the gene, designated SELPLG, closely resembles that of CD43 (OMIM Ref. No. 182160) and the human platelet glycoprotein Gplb-alpha (OMIM Ref. No. 231200), both of which have an intron in the 5-prime-noncoding region, a long second exon containing the complete coding region, and TATA-less promoters.

[12805] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12806] Herron, M. J.; Nelson, C. M.; Larson, J.; Snapp, K. R.;

Kansas, G. S.; Goodman, J. L. : Intracellular parasitism by the human granulocytic ehrlichiosis bacterium through the P-selectin ligand, PSGL-1. Science 288: 1653-1656, 2000. ; and

[12807] Veldman, G. M.; Bean, K. M.; Cumming, D. A.; Eddy, R. L.; Sait, S. N. J.; Shows, T. B. : Genomic organization and chromosomal localization of the gene encoding human P-selectin glycop.

[12808] Further studies establishing the function and utilities of SELPLG are found in John Hopkins OMIM database record ID 600738, and in cited publications numbered 7575-7578 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 12 (potassium/chloride transporters), Member 7 (SLC12A7, Accession NM_006598) is another VGAM200 host target gene. SLC12A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC12A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A7 BINDING SITE, designated SEQ ID:13375, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM

RNA, also designated SEQ ID:2911.

[12809] Another function of VGAM200 is therefore inhibition of Solute Carrier Family 12 (potassium/chloride transporters), Member 7 (SLC12A7, Accession NM_006598), a gene which is a potassium/chloride-cotransporter. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A7. The function of SLC12A7 has been established by previous studies. By searching EST databases, Mount et al. (1999) identified a cDNA encoding SLC12A7, which they initially termed KCC3 but later renamed KCC4. The deduced 1,083-amino acid SLC12A7 protein contains 12 membrane-spanning segments, 8 phosphorylation sites, 7 of which are in the C terminus, and 4 potential N-glycosylation sites. SLC12A7 shares 65% amino acid identity with SLC12A4 (OMIM Ref. No. 604119) and 66% identity with SLC12A6 (OMIM Ref. No. 604878). Northern blot analysis detected a 5.3-kb SLC12A7 transcript in most tissues tested, with highest expression in heart and kidney and little or no expression in adult brain. Functional analysis confirmed that SLC12A7 is a KCC. Animal model experiments lend further support to the function of SLC12A7. Boettger et al. (2002) gener-

ated mice constitutively lacking KCC4, which is predominantly expressed in kidney, heart, lung, and liver. *Kcc4* $-/-$ mice were born at the expected mendelian ratio. They were viable and fertile; however, their body weight was roughly 90% that of their littermates. Mice had normal hearing loss at postnatal day 14, indicated by normal auditory brainstem responses. Hearing deteriorated quickly during the following week, after which mice were nearly deaf, with a hearing loss of 70 to 80 decibels. Histologic analysis revealed that the inner ear developed normally and could not be distinguished from those of wildtype animals at postnatal day 14. At postnatal day 21, however, outer hair cells of basal turns of the cochlea were almost totally absent, whereas inner hair cells were still present. The degeneration proceeded from basal to apical turns. In adult knockout mice, the organ of Corti was lost completely in basal turns. In apical turns, some hair cells survived, accounting for the residual hearing ability in adult mice. Even in adult mice, there was no collapse of the Reissner membrane, which separates the scala media from the scala vestibuli, suggesting that *Kcc4* is not essential for endolymph production. Outer hair cells of *Kcc4* $-/-$ mice degenerated before Deiters cells were lost, although

Deiters cells and not outer hair cells normally express Kcc4 at this stage. This is consistent with a disturbance of extracellular homeostasis due to impaired salt uptake by Deiters cells, and may lead to death of outer hair cells by osmotic stress or membrane depolarization. Deafness in Kcc4 $-/-$ mice was associated with renal tubular acidosis. The urine of knockout mice was more alkaline than that of wildtype littermates, whereas concentrations of sodium, potassium, and chloride were not changed. Blood gas analysis indicated a compensated metabolic acidosis with significantly decreased base excess. Immunofluorescence revealed that Kcc4 is expressed in basolateral membranes of several nephron segments. Intracellular chloride concentration was increased in proximal tubules and particularly in alpha-intercalated cells of knockout mice. Considering the prominent chloride/bicarbonate exchange activity in alpha-intercalated cells, the rise in intracellular chloride predicts a more alkaline intracellular pH in the knockout mice. This will decrease apical proton secretion by increasing the electrochemical gradient against which pumping has to occur. Thus, KCC4 joins the hydrogen ATPase (OMIM Ref. No. 192132) and AE1 anion exchanger (OMIM Ref. No. 109270) as the third transport protein of

alpha-intercalated cells whose mutation entails renal tubular acidosis. Boettger et al. (2002) concluded that KCC4 is important for potassium recycling by siphoning potassium ions after their exit from outer hair cells into supporting Deiters cells, where potassium enters the gap junction pathway.

[12810] It is appreciated that the abovementioned animal model for SLC12A7 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[12811] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12812] Mount, D. B.; Mercado, A.; Song, L.; Xu, J.; George, A. L., Jr.; Delpire, E.; Gamba, G. : Cloning and characterization of KCC3 and KCC4, new members of the cation-chloride cotransporter gene family. J. Biol. Chem. 274: 16355–16362, 1999. ; and

[12813] Boettger, T.; Hubner, C. A.; Maler, H.; Rust, M. B.; Beck, F. X.; Jentsch, T. J. : Deafness and renal tubular acidosis in mice lacking the K-Cl co-transporter Kcc4. Nature 416: 874–878, 20.

[12814] Further studies establishing the function and utilities of

SLC12A7 are found in John Hopkins OMIM database record ID 604879, and in cited publications numbered 6944 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 38, Member 2 (SLC38A2, Accession NM_018976) is another VGAM200 host target gene. SLC38A2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC38A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC38A2 BINDING SITE, designated SEQ ID:21049, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12815] Another function of VGAM200 is therefore inhibition of Solute Carrier Family 38, Member 2 (SLC38A2, Accession NM_018976), a gene which is an amino acid transporter. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A2. The function of SLC38A2 has been established by previous studies. . Sugawara et al. (2000) cloned a rat skeletal muscle Ata2 cDNA. The deduced Ata2 protein shares 55% sequence identity with the

rat glutamine transporter GlnT (Ata1). When expressed in mammalian cells, Ata2 mediated sodium-dependent transport of MeAIB. The Ata2 transporter was specific for neutral amino acids. It was pH-sensitive and lithium-intolerant. The sodium:amino acid stoichiometry was 1:1. When expressed in *Xenopus* oocytes, transport of neutral amino acids via Ata2 was associated with inward currents. The substrate-induced current was sodium-dependent and pH-sensitive. By screening human fetal brain cDNAs for the potential to encode large proteins, Nagase et al. (2000) isolated a partial ATA2 cDNA, which they called KIAA1382, that lacks 5-prime coding sequence. The deduced 462-amino acid ATA2 partial protein shares 57% amino acid sequence identity with the human transporter protein g17 across 98% of its length. RT-PCR followed by ELISA detected ATA2 expression in all human tissues examined, with the highest level in adult brain. Within the brain, ATA2 expression was found in all regions tested, with the highest level in the subthalamic nucleus.

[12816] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

O. : Prediction of the coding sequences of unidentified human genes. XVI. The complete sequences of 150 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 7: 65–73, 2000. ; and

[12818] Sugawara, M.; Nakanishi, T.; Fei, Y.-J.; Huang, W.; Ganapathy, M. E.; Leibach, F. H.; Ganapathy, V. : Cloning of an amino acid transporter with functional characteristics and tissue exp.

[12819] Further studies establishing the function and utilities of SLC38A2 are found in John Hopkins OMIM database record ID 605180, and in cited publications numbered 6371 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Synaptogyrin 1 (SYNGR1, Accession NM_004711) is another VGAM200 host target gene. SYNGR1 BINDING SITE1 and SYNGR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SYNGR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR1 BINDING SITE1 and SYNGR1 BINDING SITE2, designated SEQ ID:11060 and SEQ ID:11068 respectively, to the nucleotide sequence of VGAM200 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2911.

[12820] Another function of VGAM200 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NM_004711), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1. The function of SYNGR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. Tripartite Motif-containing 9 (TRIM9, Accession NM_052978) is another VGAM200 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:27551, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12821] Another function of VGAM200 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession

NM_052978), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked oligosaccharides. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Transient Receptor Potential Cation Channel, Subfamily C, Member 1 (TRPC1, Accession NM_003304) is another VGAM200 host target gene. TRPC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC1 BINDING SITE, designated SEQ ID:9305, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12822] Another function of VGAM200 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C,

Member 1 (TRPC1, Accession NM_003304), a gene which acts as a non-voltage-sensitive store-operated Ca^{2+} channel. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC1. The function of TRPC1 has been established by previous studies. Zitt et al. (1996) cloned a truncated TRPC1 cDNA, which they designated TRPC1A, that lacks amino acids 109–143 of the human TRP1 sequence. By transfection studies in Chinese hamster ovary cells, Zitt et al. (1996) showed that the TRPC1A gene product functions as a store-operated calcium-permeable cation channel. Zhu et al. (1996) similarly showed that TRPC1 increased store-operated calcium entry in transfected COS cells. Xu et al. (1997) reported that the TRPC1 and TRPC3 proteins form heteromultimeric complexes. Berg et al. (1997) stated that TRPC1 is expressed in megakaryocytic cell lines and therefore may play a role in calcium homeostasis in megakaryocytes and platelets.

[12823] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12824] Zitt, C.; Zobel, A.; Obukhov, A. G.; Harteneck, C.; Kalk-

brenner, F.; Luckhoff, A.; Schultz, G. : Cloning and functional expression of a human Ca(2+)-permeable cation channel activated by calcium store depletion. Neuron 16: 1189-1196, 1996. ; and

[12825] Xu, X.-Z. S.; Li, H.-S.; Guggino, W. B.; Montell, C. : Coassembly of TRP and TRPL produces a distinct store-operated conductance. Cell 89: 1155-1164, 1997.

[12826] Further studies establishing the function and utilities of TRPC1 are found in John Hopkins OMIM database record ID 602343, and in cited publications numbered 1007-1012 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_080706) is another VGAM200 host target gene. TRPV1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRPV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPV1 BINDING SITE, designated SEQ ID:28014, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12827] Another function of VGAM200 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_080706), a gene which functions as a receptor for capsaicin. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV1. The function of TRPV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM146. Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133332) is another VGAM200 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3, designated SEQ ID:28453, SEQ ID:28470 and SEQ ID:17189 respectively, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12828] Another function of VGAM200 is therefore inhibition of

Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133332), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 has been established by previous studies. Wolf–Hirschhorn syndrome (WHS; 194190) is a malformation syndrome associated with a hemizygous deletion of the distal short arm of chromosome 4 (OMIM Ref. No. 4p16.3). The shortest region of overlap of the deletions observed in WHS patients, the WHS critical region, has been confined to a region of 165 kb (Wright et al., 1997). This region was sequenced completely during the search for the Huntington disease gene (Baxendale et al., 1993). Stec et al. (1998) described a novel developmental gene, two-thirds of which maps in the distal part of the WHS critical region. They designated the gene WHSC1 (Wolf–Hirschhorn syndrome candidate–1). The WHSC1 gene was identified initially through its high similarity to the translation product of an expressed sequence tag, located in the 165–kb WHCR, with the SET domain (see OMIM Ref. No. 600960) of the *Drosophila* protein ASH1 (OMIM Ref. No. 100790). The SET domain is found in pro–

teins that are involved in embryonic development. The 25-exon WHSC1 gene was found to be expressed ubiquitously in early development and to undergo complex alternative splicing and differential polyadenylation. It encodes a 136-kD protein containing 4 domains present in other developmental proteins: a PWWP domain, an HMG box, a SET domain also found in the *Drosophila* dysmorph gene ash-encoded protein, and a PHD-type zinc finger. It is expressed preferentially in rapidly growing embryonic tissues, in a pattern corresponding to affected organs in WHS patients. The nature of the protein motifs, the expression pattern, and its mapping to the critical region led Stec et al. (1998) to propose WHSC1 as a good candidate gene to be responsible for many of the phenotypic features of WHS. Stec et al. (1998) noted that the t(4;14)(p16.3;q32.3) translocations described in a significant fraction of multiple myelomas (Richelda et al., 1997; Chesi et al., 1997) have breakpoints located less than 100 kb centromeric of the FGFR3 gene (OMIM Ref. No. 134934) on 4p16.3. They found that at least 3 of the breakpoints merged the immunoglobulin heavy-chain gene (IGHG1; 147100) on chromosome 14 with the WHSC1 gene. This fusion of genes and their untimely ex-

pression in the myeloid lineage driven from the 5-prime IgH enhancer may indicate that WHSC1-encoded proteins are involved in the clinical heterogeneity of multiple myeloma.

[12829] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12830] Chesi, M.; Nardini, E.; Brents, L. A.; Schrock, E.; Ried, T.; Kuehl, W. M.; Bergsagel, P. [12831] Richelda, R.; Ronchetti, D.; Baldini, L.; Cro, L.; Viggiano, L.; Marzella, R.; Rocchi, M.; Otsuki, T.; Lombardi, L.; Maiolo, A. T.; Neri, A. : A novel chromosomal translocation t(4;14)(p16.

[12832] Further studies establishing the function and utilities of WHSC1 are found in John Hopkins OMIM database record ID 602952, and in cited publications numbered 1060, 1137 and 7987 listed in the bibliography section herein-below, which are also hereby incorporated by reference. Betaine-homocysteine Methyltransferase (BHMT, Ac-

cession NM_001713) is another VGAM200 host target gene. BHMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BHMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHMT BINDING SITE, designated SEQ ID:7443, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12833] Another function of VGAM200 is therefore inhibition of Betaine-homocysteine Methyltransferase (BHMT, Accession NM_001713). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHMT. Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM_014837) is another VGAM200 host target gene. C1orf16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf16 BINDING SITE, designated SEQ ID:16858, to the nucleotide sequence of VGAM200 RNA, herein designated

VGAM RNA, also designated SEQ ID:2911.

[12834] Another function of VGAM200 is therefore inhibition of Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM_014837). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf16. Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072) is another VGAM200 host target gene. C1QR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1QR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QR1 BINDING SITE, designated SEQ ID:14340, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12835] Another function of VGAM200 is therefore inhibition of Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QR1. Chromosome 20 Open Reading Frame 28 (C20orf28, Ac-

cession NM_015417) is another VGAM200 host target gene. C20orf28 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf28 BINDING SITE, designated SEQ ID:17720, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12836] Another function of VGAM200 is therefore inhibition of Chromosome 20 Open Reading Frame 28 (C20orf28, Accession NM_015417). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf28. CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_033332) is another VGAM200 host target gene. CDC14B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDC14B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ

ID:27175, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12837] Another function of VGAM200 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_033332). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. Calsyntenin 1 (CLSTN1, Accession NM_014944) is another VGAM200 host target gene. CLSTN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CLSTN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLSTN1 BINDING SITE, designated SEQ ID:17257, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12838] Another function of VGAM200 is therefore inhibition of Calsyntenin 1 (CLSTN1, Accession NM_014944). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLSTN1. CXYorf1 (Accession XM_088704) is an-

other VGAM200 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:39914, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12839] Another function of VGAM200 is therefore inhibition of CXYorf1 (Accession XM_088704). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. DKFZp434G179 (Accession XM_087065) is another VGAM200 host target gene. DKFZp434G179 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434G179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434G179 BINDING SITE, designated SEQ ID:39043, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12840] Another function of VGAM200 is therefore inhibition of DKFZp434G179 (Accession XM_087065). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434G179. DKFZp566D133 (Accession XM_050005) is another VGAM200 host target gene. DKFZp566D133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp566D133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566D133 BINDING SITE, designated SEQ ID:35544, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12841] Another function of VGAM200 is therefore inhibition of DKFZp566D133 (Accession XM_050005). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566D133. DKFZP586F1524 (Accession NM_015584) is another VGAM200 host target gene. DKFZP586F1524 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

DKFZP586F1524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586F1524 BINDING SITE, designated SEQ ID:17854, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12842] Another function of VGAM200 is therefore inhibition of DKFZP586F1524 (Accession NM_015584). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586F1524. Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM_047295) is another VGAM200 host target gene. EPB41L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPB41L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB41L1 BINDING SITE, designated SEQ ID:34946, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12843] Another function of VGAM200 is therefore inhibition of

Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM_047295). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L1. FLJ12229 (Accession NM_024876) is another VGAM200 host target gene. FLJ12229 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12229 BINDING SITE, designated SEQ ID:24310, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12844] Another function of VGAM200 is therefore inhibition of FLJ12229 (Accession NM_024876). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12229. FLJ12529 (Accession NM_024811) is another VGAM200 host target gene. FLJ12529 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12529 BINDING SITE, designated SEQ ID:24192, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12845] Another function of VGAM200 is therefore inhibition of FLJ12529 (Accession NM_024811). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12529. FLJ12688 (Accession XM_055071) is another VGAM200 host target gene. FLJ12688 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12688 BINDING SITE, designated SEQ ID:36222, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12846] Another function of VGAM200 is therefore inhibition of FLJ12688 (Accession XM_055071). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12688.

FLJ14708 (Accession NM_032827) is another VGAM200 host target gene. FLJ14708 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14708, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14708 BINDING SITE, designated SEQ ID:26601, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12847] Another function of VGAM200 is therefore inhibition of FLJ14708 (Accession NM_032827). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14708. FLJ14855 (Accession NM_033210) is another VGAM200 host target gene. FLJ14855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14855 BINDING SITE, designated SEQ ID:27059, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2911.

[12848] Another function of VGAM200 is therefore inhibition of FLJ14855 (Accession NM_033210). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14855. FLJ20069 (Accession NM_017651) is another VGAM200 host target gene. FLJ20069 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20069 BINDING SITE, designated SEQ ID:19158, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12849] Another function of VGAM200 is therefore inhibition of FLJ20069 (Accession NM_017651). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20069. FLJ20232 (Accession NM_019008) is another VGAM200 host target gene. FLJ20232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20232, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20232 BINDING SITE, designated SEQ ID:21087, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12850] Another function of VGAM200 is therefore inhibition of FLJ20232 (Accession NM_019008). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20232. FLJ20294 (Accession NM_017749) is another VGAM200 host target gene. FLJ20294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294 BINDING SITE, designated SEQ ID:19348, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12851] Another function of VGAM200 is therefore inhibition of FLJ20294 (Accession NM_017749). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ20294. FLJ20507 (Accession NM_017849) is another VGAM200 host target gene. FLJ20507 BINDING SITE1 and FLJ20507 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20507, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20507 BINDING SITE1 and FLJ20507 BINDING SITE2, designated SEQ ID:19514 and SEQ ID:30222 respectively, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12852] Another function of VGAM200 is therefore inhibition of FLJ20507 (Accession NM_017849). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20507. FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513) is another VGAM200 host target gene. FYCO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FYCO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of FYCO1 BINDING SITE, designated SEQ ID:23707, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12853] Another function of VGAM200 is therefore inhibition of FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FYCO1. Growth Differentiation Factor 10 (GDF10, Accession NM_004962) is another VGAM200 host target gene. GDF10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GDF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDF10 BINDING SITE, designated SEQ ID:11410, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12854] Another function of VGAM200 is therefore inhibition of Growth Differentiation Factor 10 (GDF10, Accession NM_004962). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with GDF10. GMPPB (Accession XM_171044) is another VGAM200 host target gene. GMPPB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GMPPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMPPB BINDING SITE, designated SEQ ID:45820, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12855] Another function of VGAM200 is therefore inhibition of GMPPB (Accession XM_171044). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB. HCCA2 (Accession XM_039894) is another VGAM200 host target gene. HCCA2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HCCA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCCA2 BINDING SITE, designated SEQ ID:33204, to the nucleotide sequence of VGAM200

RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12856] Another function of VGAM200 is therefore inhibition of HCCA2 (Accession XM_039894). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCCA2. Interleukin 14 (IL14, Accession XM_170924) is another VGAM200 host target gene. IL14 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IL14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL14 BINDING SITE, designated SEQ ID:45706, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12857] Another function of VGAM200 is therefore inhibition of Interleukin 14 (IL14, Accession XM_170924). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL14. ISL2 Transcription Factor, LIM/homeodomain, (islet-2) (ISL2, Accession XM_047951) is another VGAM200 host target gene. ISL2 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by ISL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ISL2 BINDING SITE, designated SEQ ID:35082, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12858] Another function of VGAM200 is therefore inhibition of ISL2 Transcription Factor, LIM/homeodomain, (islet-2) (ISL2, Accession XM_047951). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ISL2. Potassium Voltage-gated Channel, Shab-related Subfamily, Member 2 (KCNB2, Accession XM_171186) is another VGAM200 host target gene. KCNB2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNB2 BINDING SITE, designated SEQ ID:45965, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:2911.

[12859] Another function of VGAM200 is therefore inhibition of Potassium Voltage-gated Channel, Shab-related Subfamily, Member 2 (KCNB2, Accession XM_171186). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNB2. KIAA0040 (Accession NM_014656) is another VGAM200 host target gene. KIAA0040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0040 BINDING SITE, designated SEQ ID:16095, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12860] Another function of VGAM200 is therefore inhibition of KIAA0040 (Accession NM_014656). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0040. KIAA0237 (Accession NM_014747) is another VGAM200 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16457, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12861] Another function of VGAM200 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0415 (Accession XM_166527) is another VGAM200 host target gene. KIAA0415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0415 BINDING SITE, designated SEQ ID:44478, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12862] Another function of VGAM200 is therefore inhibition of KIAA0415 (Accession XM_166527). Accordingly, utilities

of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0415. KIAA0469 (Accession NM_014851) is another VGAM200 host target gene. KIAA0469 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:16898, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12863] Another function of VGAM200 is therefore inhibition of KIAA0469 (Accession NM_014851). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469. KIAA0495 (Accession XM_031397) is another VGAM200 host target gene. KIAA0495 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0495 BINDING SITE, designated SEQ ID:31359, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12864] Another function of VGAM200 is therefore inhibition of KIAA0495 (Accession XM_031397). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495. KIAA0574 (Accession XM_045076) is another VGAM200 host target gene. KIAA0574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0574 BINDING SITE, designated SEQ ID:34349, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12865] Another function of VGAM200 is therefore inhibition of KIAA0574 (Accession XM_045076). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0574. KIAA0763 (Accession NM_014869) is another VGAM200 host target gene. KIAA0763 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0763 BINDING SITE, designated SEQ ID:16972, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12866] Another function of VGAM200 is therefore inhibition of KIAA0763 (Accession NM_014869). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0763. KIAA0773 (Accession NM_014690) is another VGAM200 host target gene. KIAA0773 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0773 BINDING SITE, designated SEQ ID:16195, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12867] Another function of VGAM200 is therefore inhibition of

KIAA0773 (Accession NM_014690). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0773. KIAA0930 (Accession XM_047214) is another VGAM200 host target gene. KIAA0930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0930 BINDING SITE, designated SEQ ID:34914, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12868] Another function of VGAM200 is therefore inhibition of KIAA0930 (Accession XM_047214). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0930. KIAA0939 (Accession XM_030524) is another VGAM200 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31059, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12869] Another function of VGAM200 is therefore inhibition of KIAA0939 (Accession XM_030524). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. KIAA1014 (Accession XM_037205) is another VGAM200 host target gene. KIAA1014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1014 BINDING SITE, designated SEQ ID:32571, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12870] Another function of VGAM200 is therefore inhibition of KIAA1014 (Accession XM_037205). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1014. KIAA1297 (Accession XM_051005) is another

VGAM200 host target gene. KIAA1297 BINDING SITE1 and KIAA1297 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1297, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE1 and KIAA1297 BINDING SITE2, designated SEQ ID:35722 and SEQ ID:35723 respectively, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12871] Another function of VGAM200 is therefore inhibition of KIAA1297 (Accession XM_051005). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. KIAA1649 (Accession NM_032311) is another VGAM200 host target gene. KIAA1649 BINDING SITE1 and KIAA1649 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1649, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE1 and KIAA1649

BINDING SITE2, designated SEQ ID:26107 and SEQ ID:33256 respectively, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12872] Another function of VGAM200 is therefore inhibition of KIAA1649 (Accession NM_032311). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. KIAA1870 (Accession NM_032888) is another VGAM200 host target gene. KIAA1870 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1870 BINDING SITE, designated SEQ ID:26708, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12873] Another function of VGAM200 is therefore inhibition of KIAA1870 (Accession NM_032888). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1870. KIAA1884 (Accession XM_055539) is another

VGAM200 host target gene. KIAA1884 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1884 BINDING SITE, designated SEQ ID:36294, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12874] Another function of VGAM200 is therefore inhibition of KIAA1884 (Accession XM_055539). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1884. KIAA1944 (Accession XM_062545) is another VGAM200 host target gene. KIAA1944 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1944 BINDING SITE, designated SEQ ID:37227, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12875] Another function of VGAM200 is therefore inhibition of KIAA1944 (Accession XM_062545). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1944. Mannosidase, Alpha, Class 1C, Member 1 (MAN1C1, Accession NM_020379) is another VGAM200 host target gene. MAN1C1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAN1C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN1C1 BINDING SITE, designated SEQ ID:21646, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12876] Another function of VGAM200 is therefore inhibition of Mannosidase, Alpha, Class 1C, Member 1 (MAN1C1, Accession NM_020379). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN1C1. MGC19556 (Accession NM_033551) is another VGAM200 host target gene. MGC19556 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of

mRNA encoded by MGC19556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC19556 BINDING SITE, designated SEQ ID:27318, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12877] Another function of VGAM200 is therefore inhibition of MGC19556 (Accession NM_033551). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC19556. MGC20460 (Accession NM_053043) is another VGAM200 host target gene. MGC20460 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC20460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20460 BINDING SITE, designated SEQ ID:27587, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12878] Another function of VGAM200 is therefore inhibition of MGC20460 (Accession NM_053043). Accordingly, utilities

of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20460. MICAL (Accession NM_022765) is another VGAM200 host target gene. MICAL BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MICAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MICAL BINDING SITE, designated SEQ ID:23011, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12879] Another function of VGAM200 is therefore inhibition of MICAL (Accession NM_022765). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MICAL. My015 (Accession XM_039512) is another VGAM200 host target gene. My015 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by My015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of My015 BINDING SITE, designated SEQ

ID:33108, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12880] Another function of VGAM200 is therefore inhibition of My015 (Accession XM_039512). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with My015. Myelin Transcription Factor 1 (MYT1, Accession NM_004535) is another VGAM200 host target gene. MYT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYT1 BINDING SITE, designated SEQ ID:10875, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12881] Another function of VGAM200 is therefore inhibition of Myelin Transcription Factor 1 (MYT1, Accession NM_004535). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYT1. Phosphate Cytidylyltransferase 2, Ethanolamine (PCYT2, Accession

NM_002861) is another VGAM200 host target gene.

PCYT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCYT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCYT2 BINDING SITE, designated SEQ ID:8762, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12882] Another function of VGAM200 is therefore inhibition of Phosphate Cytidylyltransferase 2, Ethanolamine (PCYT2, Accession NM_002861). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCYT2. Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM_138687) is another VGAM200 host target gene. PIP5K2B BINDING SITE1 and PIP5K2B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PIP5K2B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K2B BINDING SITE1 and PIP5K2B BINDING SITE2, des-

ignated SEQ ID:28929 and SEQ ID:9607 respectively, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12883] Another function of VGAM200 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM_138687). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K2B. Phosphatidylserine Decarboxylase (PISD, Accession NM_014338) is another VGAM200 host target gene. PISD BINDING SITE1 and PISD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PISD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PISD BINDING SITE1 and PISD BINDING SITE2, designated SEQ ID:15658 and SEQ ID:18234 respectively, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12884] Another function of VGAM200 is therefore inhibition of Phosphatidylserine Decarboxylase (PISD, Accession NM_014338). Accordingly, utilities of VGAM200 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PISD. PRO1163 (Accession NM_018576) is another VGAM200 host target gene.

PRO1163 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1163 BINDING SITE, designated SEQ ID:20655, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12885] Another function of VGAM200 is therefore inhibition of PRO1163 (Accession NM_018576). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1163. Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM_144564) is another VGAM200 host target gene. SLC39A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC39A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of SLC39A3 BINDING SITE, designated SEQ ID:29362, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12886] Another function of VGAM200 is therefore inhibition of Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM_144564). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC39A3. TED (Accession NM_015686) is another VGAM200 host target gene. TED BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TED, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TED BINDING SITE, designated SEQ ID:17918, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12887] Another function of VGAM200 is therefore inhibition of TED (Accession NM_015686). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TED.

Testis Specific, 14 (TSGA14, Accession NM_018718) is another VGAM200 host target gene. TSGA14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSGA14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSGA14 BINDING SITE, designated SEQ ID:20796, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12888] Another function of VGAM200 is therefore inhibition of Testis Specific, 14 (TSGA14, Accession NM_018718). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSGA14. Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353) is another VGAM200 host target gene. ZDHHC2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZDHHC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC2 BINDING SITE, designated SEQ ID:18489, to the nucleotide

sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12889] Another function of VGAM200 is therefore inhibition of Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC2. LOC115073 (Accession XM_055193) is another VGAM200 host target gene. LOC115073 BINDING SITE1 and LOC115073 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC115073, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115073 BINDING SITE1 and LOC115073 BINDING SITE2, designated SEQ ID:36243 and SEQ ID:36244 respectively, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12890] Another function of VGAM200 is therefore inhibition of LOC115073 (Accession XM_055193). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC115073. LOC129138 (Accession NM_138797) is another VGAM200 host target gene. LOC129138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129138 BINDING SITE, designated SEQ ID:29020, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12891] Another function of VGAM200 is therefore inhibition of LOC129138 (Accession NM_138797). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129138. LOC132235 (Accession XM_072302) is another VGAM200 host target gene. LOC132235 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC132235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132235 BINDING SITE, designated SEQ ID:37484, to the nucleotide sequence of VGAM200 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2911.

[12892] Another function of VGAM200 is therefore inhibition of LOC132235 (Accession XM_072302). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132235. LOC143310 (Accession XM_084485) is another VGAM200 host target gene. LOC143310 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143310 BINDING SITE, designated SEQ ID:37608, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12893] Another function of VGAM200 is therefore inhibition of LOC143310 (Accession XM_084485). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143310. LOC144317 (Accession XM_084813) is another VGAM200 host target gene. LOC144317 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144317, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144317 BINDING SITE, designated SEQ ID:37719, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12894] Another function of VGAM200 is therefore inhibition of LOC144317 (Accession XM_084813). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144317. LOC144699 (Accession XM_084940) is another VGAM200 host target gene. LOC144699 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144699, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144699 BINDING SITE, designated SEQ ID:37770, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12895] Another function of VGAM200 is therefore inhibition of LOC144699 (Accession XM_084940). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC144699. LOC145717 (Accession XM_039771) is another VGAM200 host target gene. LOC145717 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145717, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145717 BINDING SITE, designated SEQ ID:33191, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12896] Another function of VGAM200 is therefore inhibition of LOC145717 (Accession XM_039771). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145717. LOC146520 (Accession XM_085492) is another VGAM200 host target gene. LOC146520 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146520 BINDING SITE, designated SEQ ID:38189, to

the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12897] Another function of VGAM200 is therefore inhibition of LOC146520 (Accession XM_085492). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146520. LOC147664 (Accession XM_085826) is another VGAM200 host target gene. LOC147664 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147664 BINDING SITE, designated SEQ ID:38353, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12898] Another function of VGAM200 is therefore inhibition of LOC147664 (Accession XM_085826). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147664. LOC148029 (Accession XM_086014) is another VGAM200 host target gene. LOC148029 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC148029, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148029 BINDING SITE, designated SEQ ID:38448, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12899] Another function of VGAM200 is therefore inhibition of LOC148029 (Accession XM_086014). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148029. LOC149950 (Accession XM_086732) is another VGAM200 host target gene. LOC149950 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149950 BINDING SITE, designated SEQ ID:38841, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12900] Another function of VGAM200 is therefore inhibition of LOC149950 (Accession XM_086732). Accordingly, utilities

of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149950. LOC150245 (Accession XM_097843) is another VGAM200 host target gene. LOC150245 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150245 BINDING SITE, designated SEQ ID:41165, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12901] Another function of VGAM200 is therefore inhibition of LOC150245 (Accession XM_097843). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150245. LOC152992 (Accession XM_087575) is another VGAM200 host target gene. LOC152992 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC152992 BINDING SITE, designated SEQ ID:39351, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12902] Another function of VGAM200 is therefore inhibition of LOC152992 (Accession XM_087575). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152992. LOC154092 (Accession XM_098466) is another VGAM200 host target gene. LOC154092 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154092 BINDING SITE, designated SEQ ID:41682, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12903] Another function of VGAM200 is therefore inhibition of LOC154092 (Accession XM_098466). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154092. LOC158428 (Accession XM_047249) is another VGAM200 host target gene. LOC158428 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158428 BINDING SITE, designated SEQ ID:34923, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12904] Another function of VGAM200 is therefore inhibition of LOC158428 (Accession XM_047249). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158428. LOC158434 (Accession XM_098939) is another VGAM200 host target gene. LOC158434 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158434 BINDING SITE, designated SEQ ID:41987, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12905] Another function of VGAM200 is therefore inhibition of

LOC158434 (Accession XM_098939). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158434. LOC158515 (Accession XM_092979) is another VGAM200 host target gene. LOC158515 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158515 BINDING SITE, designated SEQ ID:40162, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12906] Another function of VGAM200 is therefore inhibition of LOC158515 (Accession XM_092979). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158515. LOC161635 (Accession XM_172921) is another VGAM200 host target gene. LOC161635 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC161635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC161635 BINDING SITE, designated SEQ ID:46186, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12907] Another function of VGAM200 is therefore inhibition of LOC161635 (Accession XM_172921). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161635. LOC195977 (Accession XM_113625) is another VGAM200 host target gene. LOC195977 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC195977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC195977 BINDING SITE, designated SEQ ID:42301, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12908] Another function of VGAM200 is therefore inhibition of LOC195977 (Accession XM_113625). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC195977. LOC199786 (Accession XM_114021) is an-

other VGAM200 host target gene. LOC199786 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199786 BINDING SITE, designated SEQ ID:42622, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12909] Another function of VGAM200 is therefore inhibition of LOC199786 (Accession XM_114021). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199786. LOC200093 (Accession XM_032184) is another VGAM200 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE, designated SEQ ID:31606, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12910] Another function of VGAM200 is therefore inhibition of LOC200093 (Accession XM_032184). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. LOC200138 (Accession XM_117194) is another VGAM200 host target gene. LOC200138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200138 BINDING SITE, designated SEQ ID:43280, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12911] Another function of VGAM200 is therefore inhibition of LOC200138 (Accession XM_117194). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200138. LOC200918 (Accession XM_114316) is another VGAM200 host target gene. LOC200918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200918, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200918 BINDING SITE, designated SEQ ID:42870, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12912] Another function of VGAM200 is therefore inhibition of LOC200918 (Accession XM_114316). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200918. LOC205418 (Accession XM_119792) is another VGAM200 host target gene. LOC205418 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC205418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205418 BINDING SITE, designated SEQ ID:43598, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12913] Another function of VGAM200 is therefore inhibition of LOC205418 (Accession XM_119792). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC205418. LOC220980 (Accession XM_167629) is another VGAM200 host target gene. LOC220980 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220980 BINDING SITE, designated SEQ ID:44741, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12914] Another function of VGAM200 is therefore inhibition of LOC220980 (Accession XM_167629). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220980. LOC221751 (Accession XM_166370) is another VGAM200 host target gene. LOC221751 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221751, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221751 BINDING SITE, designated SEQ ID:44189, to the nucleotide sequence of VGAM200 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2911.

[12915] Another function of VGAM200 is therefore inhibition of LOC221751 (Accession XM_166370). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221751. LOC245727 (Accession XM_165913) is another VGAM200 host target gene. LOC245727 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC245727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245727 BINDING SITE, designated SEQ ID:43796, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12916] Another function of VGAM200 is therefore inhibition of LOC245727 (Accession XM_165913). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245727. LOC253001 (Accession XM_171711) is another VGAM200 host target gene. LOC253001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253001, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253001 BINDING SITE, designated SEQ ID:46059, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12917] Another function of VGAM200 is therefore inhibition of LOC253001 (Accession XM_171711). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253001. LOC253070 (Accession XM_173088) is another VGAM200 host target gene. LOC253070 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253070 BINDING SITE, designated SEQ ID:46353, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12918] Another function of VGAM200 is therefore inhibition of LOC253070 (Accession XM_173088). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC253070. LOC253805 (Accession XM_172854) is another VGAM200 host target gene. LOC253805 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253805 BINDING SITE, designated SEQ ID:46138, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12919] Another function of VGAM200 is therefore inhibition of LOC253805 (Accession XM_172854). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253805. LOC253959 (Accession XM_170749) is another VGAM200 host target gene. LOC253959 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253959, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253959 BINDING SITE, designated SEQ ID:45510, to

the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12920] Another function of VGAM200 is therefore inhibition of LOC253959 (Accession XM_170749). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253959. LOC254387 (Accession XM_170731) is another VGAM200 host target gene. LOC254387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254387 BINDING SITE, designated SEQ ID:45489, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12921] Another function of VGAM200 is therefore inhibition of LOC254387 (Accession XM_170731). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254387. LOC254532 (Accession XM_172961) is another VGAM200 host target gene. LOC254532 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC254532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254532 BINDING SITE, designated SEQ ID:46208, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12922] Another function of VGAM200 is therefore inhibition of LOC254532 (Accession XM_172961). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254532. LOC255650 (Accession XM_172981) is another VGAM200 host target gene. LOC255650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255650 BINDING SITE, designated SEQ ID:46248, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12923] Another function of VGAM200 is therefore inhibition of LOC255650 (Accession XM_172981). Accordingly, utilities

of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255650. LOC256158 (Accession XM_175125) is another VGAM200 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46633, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12924] Another function of VGAM200 is therefore inhibition of LOC256158 (Accession XM_175125). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. LOC256248 (Accession XM_172550) is another VGAM200 host target gene. LOC256248 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256248 BINDING SITE, designated SEQ ID:46075, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12925] Another function of VGAM200 is therefore inhibition of LOC256248 (Accession XM_172550). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256248. LOC256790 (Accession XM_170679) is another VGAM200 host target gene. LOC256790 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256790 BINDING SITE, designated SEQ ID:45461, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12926] Another function of VGAM200 is therefore inhibition of LOC256790 (Accession XM_170679). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256790. LOC89958 (Accession XM_027627) is another VGAM200 host target gene. LOC89958 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC89958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89958 BINDING SITE, designated SEQ ID:30544, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12927] Another function of VGAM200 is therefore inhibition of LOC89958 (Accession XM_027627). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89958. LOC90362 (Accession XM_031163) is another VGAM200 host target gene. LOC90362 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90362 BINDING SITE, designated SEQ ID:31296, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12928] Another function of VGAM200 is therefore inhibition of

LOC90362 (Accession XM_031163). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90362. LOC90678 (Accession NM_138361) is another VGAM200 host target gene. LOC90678 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90678 BINDING SITE, designated SEQ ID:28748, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12929] Another function of VGAM200 is therefore inhibition of LOC90678 (Accession NM_138361). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90678. LOC90841 (Accession XM_034427) is another VGAM200 host target gene. LOC90841 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC90841 BINDING SITE, designated SEQ ID:32114, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12930] Another function of VGAM200 is therefore inhibition of LOC90841 (Accession XM_034427). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90841. LOC90925 (Accession XM_034917) is another VGAM200 host target gene. LOC90925 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90925 BINDING SITE, designated SEQ ID:32187, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12931] Another function of VGAM200 is therefore inhibition of LOC90925 (Accession XM_034917). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90925. LOC91040 (Accession XM_035641) is another

VGAM200 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:32323, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12932] Another function of VGAM200 is therefore inhibition of LOC91040 (Accession XM_035641). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. LOC91409 (Accession XM_038298) is another VGAM200 host target gene. LOC91409 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91409 BINDING SITE, designated SEQ ID:32807, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12933] Another function of VGAM200 is therefore inhibition of LOC91409 (Accession XM_038298). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91409. LOC91663 (Accession NM_138373) is another VGAM200 host target gene. LOC91663 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91663 BINDING SITE, designated SEQ ID:28754, to the nucleotide sequence of VGAM200 RNA, herein designated VGAM RNA, also designated SEQ ID:2911.

[12934] Another function of VGAM200 is therefore inhibition of LOC91663 (Accession NM_138373). Accordingly, utilities of VGAM200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91663. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 201 (VGAM201) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[12935] VGAM201 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM201 was detected is described hereinabove with reference to Figs. 1–8.

[12936] VGAM201 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM201 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12937] VGAM201 gene encodes a VGAM201 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM201 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM201 precursor RNA is designated SEQ ID:187, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:187 is located at position 124735 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12938] VGAM201 precursor RNA folds onto itself, forming

VGAM201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12939] An enzyme complex designated DICER COMPLEX, `dices` the VGAM201 folded precursor RNA into VGAM201 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM201 RNA is designated SEQ ID:2912, and is provided hereinbelow with reference to the sequence listing part.

[12940] VGAM201 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM201 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM201 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12941] VGAM201 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM201 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM201 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM201 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM201 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12942] The complementary binding of VGAM201 RNA, herein designated VGAM RNA, to host target binding sites on VGAM201 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM201 host target RNA into VGAM201 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12943] It is appreciated that VGAM201 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM201 host target genes. The mRNA of each one of this plurality of VGAM201 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM201 RNA, herein designated VGAM RNA, and which when bound by VGAM201 RNA causes inhibition of translation of respective one or more VGAM201 host target proteins.

[12944] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM201 gene, herein designated VGAM GENE, on one or more VGAM201 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12945] It is yet further appreciated that a function of VGAM201 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM201 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM201 correlate with, and may be deduced from, the identity of the host

target genes which VGAM201 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [12946] Nucleotide sequences of the VGAM201 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM201 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM201 are further described hereinbelow with reference to Table 1.
- [12947] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM201 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM201 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [12948] As mentioned hereinabove with reference to Fig. 1, a function of VGAM201 gene, herein designated VGAM is inhibition of expression of VGAM201 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM201 correlate with, and may be deduced from, the identity of the target genes which VGAM201

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12949] FCRH1 (Accession NM_052938) is a VGAM201 host target gene. FCRH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FCRH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCRH1 BINDING SITE, designated SEQ ID:27496, to the nucleotide sequence of VGAM201 RNA, herein designated VGAM RNA, also designated SEQ ID:2912.

[12950] A function of VGAM201 is therefore inhibition of FCRH1 (Accession NM_052938). Accordingly, utilities of VGAM201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCRH1. Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM_024080) is another VGAM201 host target gene. TRPM8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRPM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of TRPM8 BINDING SITE, designated SEQ ID:23512, to the nucleotide sequence of VGAM201 RNA, herein designated VGAM RNA, also designated SEQ ID:2912.

[12951] Another function of VGAM201 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM_024080), a gene which is thought to form a receptor-activated calcium permeant cation channel. Accordingly, utilities of VGAM201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM8. The function of TRPM8 has been established by previous studies. Using expression cloning of a rat trigeminal nerve cDNA library in a human embryonic kidney cell line and screening for changes in intracellular calcium on exposure to room-temperature menthol, McKemy et al. (2002) identified a cDNA encoding Cmr1 (cold-menthol receptor-1). The deduced 1,104-amino acid protein, 92% identical to human TRPM8, is also responsive to icilin, cold (with a range from 8 to 28 degrees C), and eucalyptol (the main constituent of oil of Eucalyptus) with low or no responses to menthone, camphor, cyclohexanol, or capsaicin, the agonist for VR1, which is related to the TRP family. Northern blot

analysis detected transcripts of 6.0 and 4.5 kb in rat dorsal root ganglia and trigeminal neurons. In situ hybridization analysis demonstrated expression in small-diameter, but not larger-diameter, sensory neurons, similar in size to VR1-expressing cells. Cells expressing both Cmr1 and Vr1 endow cells to respond to distinct temperature thresholds, cool and hot (more than 43 degrees C), respectively. McKemy et al. (2002) suggested this coexpression may explain the paradox that noxious cold is sometimes perceived as burning pain. The authors also proposed that in other contexts, such as prostate and tumors, an endogenous menthol-like ligand may modulate the TRPM8 channel. Peier et al. (2002) showed that mouse Trpm8 is specifically expressed in a subset of pain- and temperature-sensing neurons. Cells overexpressing the Trpm8 channel could be activated by cold temperatures and by a cooling agent, menthol. The authors concluded that the identification of a cold-sensing TRP channel in a distinct subpopulation of sensory neurons implicated an expanded role for this family of ion channels in somatic sensory detection.

[12952] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [12953] McKemy, D. D.; Neuhausser, W. M.; Julius, D. : Identification of a cold receptor reveals a general role for TRP channels in thermosensation. *Nature* 416: 52–58, 2002. ; and
- [12954] Peier, A. M.; Moqrich, A.; Hergarden, A. C.; Reeve, A. J.; Andersson, D. A.; Story, G. M.; Earley, T. J.; Dragoni, I.; McIntyre, P.; Bevan, S.; Patapoutian, A. : A TRP channel that sense.
- [12955] Further studies establishing the function and utilities of TRPM8 are found in John Hopkins OMIM database record ID 606678, and in cited publications numbered 5545–554 and 4909 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC154222 (Accession XM_098497) is another VGAM201 host target gene. LOC154222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154222 BINDING SITE, designated SEQ ID:41688, to the nucleotide sequence of VGAM201 RNA, herein designated VGAM RNA, also designated SEQ ID:2912.

[12956] Another function of VGAM201 is therefore inhibition of LOC154222 (Accession XM_098497). Accordingly, utilities of VGAM201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154222. LOC221814 (Accession XM_168226) is another VGAM201 host target gene. LOC221814 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221814 BINDING SITE, designated SEQ ID:45089, to the nucleotide sequence of VGAM201 RNA, herein designated VGAM RNA, also designated SEQ ID:2912.

[12957] Another function of VGAM201 is therefore inhibition of LOC221814 (Accession XM_168226). Accordingly, utilities of VGAM201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221814. LOC91397 (Accession XM_038219) is another VGAM201 host target gene. LOC91397 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91397, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91397 BINDING SITE, designated SEQ ID:32778, to the nucleotide sequence of VGAM201 RNA, herein designated VGAM RNA, also designated SEQ ID:2912.

[12958] Another function of VGAM201 is therefore inhibition of LOC91397 (Accession XM_038219). Accordingly, utilities of VGAM201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91397. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 202 (VGAM202) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12959] VGAM202 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM202 was detected is described hereinabove with reference to Figs. 1–8.

[12960] VGAM202 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM202 host

target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12961] VGAM202 gene encodes a VGAM202 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM202 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM202 precursor RNA is designated SEQ ID:188, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:188 is located at position 276485 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12962] VGAM202 precursor RNA folds onto itself, forming VGAM202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12963] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM202 folded precursor RNA into VGAM202 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM202 RNA is designated SEQ ID:2913, and is provided hereinbelow with reference to the sequence listing part.

[12964] VGAM202 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM202 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM202 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12965] VGAM202 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM202 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM202 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM202 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM202 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12966] The complementary binding of VGAM202 RNA, herein designated VGAM RNA, to host target binding sites on VGAM202 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM202 host target RNA into VGAM202 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12967] It is appreciated that VGAM202 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM202 host target genes. The mRNA of each one of this plurality of VGAM202 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM202 RNA, herein designated VGAM RNA, and which when bound by VGAM202 RNA causes inhibition of translation of respective one or more VGAM202 host target proteins.

[12968] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM202 gene, herein designated VGAM GENE, on one or more VGAM202 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12969] It is yet further appreciated that a function of VGAM202 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM202 correlate with, and may be deduced from, the identity of the host target genes which VGAM202 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12970] Nucleotide sequences of the VGAM202 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM202 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM202 are further

described hereinbelow with reference to Table 1.

[12971] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM202 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM202 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12972] As mentioned hereinabove with reference to Fig. 1, a function of VGAM202 gene, herein designated VGAM is inhibition of expression of VGAM202 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM202 correlate with, and may be deduced from, the identity of the target genes which VGAM202 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12973] Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM_085082) is a VGAM202 host target gene. ARHGAP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGAP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of ARHGAP5 BINDING SITE, designated SEQ ID:37815, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:2913.

[12974] A function of VGAM202 is therefore inhibition of Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM_085082). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP5. PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335) is another VGAM202 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30675, to the nucleotide sequence of VGAM202 RNA, herein designated VGAM RNA, also designated SEQ ID:2913.

[12975] Another function of VGAM202 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335). Accordingly, utilities of VGAM202 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PRPF8.

Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 203 (VGAM203) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12976] VGAM203 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM203 was detected is described hereinabove with reference to Figs. 1–8.

[12977] VGAM203 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM203 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12978] VGAM203 gene encodes a VGAM203 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM203 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM203 precursor RNA is designated SEQ ID:189, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:189 is located at position 64186 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[12979] VGAM203 precursor RNA folds onto itself, forming VGAM203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12980] An enzyme complex designated DICER COMPLEX, `dices` the VGAM203 folded precursor RNA into VGAM203 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM203 RNA is designated SEQ ID:2914, and is provided hereinbelow with reference to the sequence

listing part.

[12981] VGAM203 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM203 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM203 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12982] VGAM203 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM203 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM203 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM203 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM203 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12983] The complementary binding of VGAM203 RNA, herein designated VGAM RNA, to host target binding sites on VGAM203 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM203 host target RNA into VGAM203 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12984] It is appreciated that VGAM203 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM203 host target genes. The mRNA of each one of this plurality of VGAM203 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM203 RNA, herein designated VGAM

RNA, and which when bound by VGAM203 RNA causes inhibition of translation of respective one or more VGAM203 host target proteins.

[12985] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM203 gene, herein designated VGAM GENE, on one or more VGAM203 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[12986] It is yet further appreciated that a function of VGAM203 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM203 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM203 correlate with, and may be deduced from, the identity of the host target genes which VGAM203 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12987] Nucleotide sequences of the VGAM203 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM203 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM203 are further described hereinbelow with reference to Table 1.

[12988] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM203 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM203 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12989] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM203 gene, herein designated VGAM is inhibition of expression of VGAM203 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM203 correlate with, and may be deduced from, the identity of the target genes which VGAM203 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12990] Calcium Channel, Voltage-dependent, Alpha 2/delta Subunit 2 (CACNA2D2, Accession NM_006030) is a VGAM203 host target gene. CACNA2D2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CACNA2D2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNA2D2 BINDING SITE, designated SEQ ID:12646, to the nucleotide sequence of VGAM203 RNA, herein designated VGAM RNA, also designated SEQ ID:2914.

[12991] A function of VGAM203 is therefore inhibition of Calcium Channel, Voltage-dependent, Alpha 2/delta Subunit 2 (CACNA2D2, Accession NM_006030), a gene which is a calcium channel protein which plays an important role in excitation-contraction coupling. Accordingly, utilities of

VGAM203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA2D2. The function of CACNA2D2 has been established by previous studies. By physical cloning methodologies and bioinformatic computational analyses, Lerman and Minna (2000) identified a number of genes, including CACNA2D2, in a region of chromosome 3p21.3 that is associated with a putative lung cancer tumor suppressor gene. They did not detect CACNA2D2 mutations in any lung cancer cell lines tested. Animal model experiments lend further support to the function of CACNA2D2. Brodbeck et al. (2002) showed that mice with the 'duffy' (du) mutation, a model for absence epilepsy (see OMIM Ref. No. 600131), had a mutation in Cacna2d2 gene. The mutation resulted in the introduction of a premature stop codon and the expression of a truncated protein encoded by the first 3 exons of Cacna2d2, followed by 8 novel amino acids. The shortened mRNA and protein were expressed in mutant mouse cerebellum and Purkinje cells. Brodbeck et al. (2002) detected high expression of the normal protein in cerebellar Purkinje cells, but found that duffy mice had abnormalities in their Purkinje cell dendritic trees. Functional analysis indicated that the mutant

Cacna2d2 protein failed to increase or even decreased the peak current density of the voltage-gated Ca(V)2.1 (CACNA1A; 601011)/beta-4 (CACNB4; 601949) channel combination, suggesting that it may contribute to the ducky phenotype.

[12992] It is appreciated that the abovementioned animal model for CACNA2D2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[12993] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12994] Brodbeck, J.; Davies, A.; Courtney, J.-M.; Meir, A.; Balaguero, N.; Canti, C.; Moss, F. J.; Page, K. M.; Pratt, W. S.; Hunt, S. P.; Barclay, J.; Rees, M.; Dolphin, A. C. : The ducky mutation in Cacna2d2 results in altered Purkinje cell morphology and is associated with the expression of a truncated alpha-2/delta-2 protein with abnormal function. J. Biol. Chem. 277: 7684-7693, 2002. ; and

[12995] Lerman, M. I.; Minna, J. D. : The 630-kb lung cancer homozygous deletion region on human chromosome 3p21.3: identification and evaluation of the resident candidate tumor suppressor gene.

[12996] Further studies establishing the function and utilities of CACNA2D2 are found in John Hopkins OMIM database record ID 607082, and in cited publications numbered 5491–5492, 10 and 6735 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ferredoxin 1 (FDX1, Accession XM_016467) is another VGAM203 host target gene. FDX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FDX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FDX1 BINDING SITE, designated SEQ ID:30259, to the nucleotide sequence of VGAM203 RNA, herein designated VGAM RNA, also designated SEQ ID:2914.

[12997] Another function of VGAM203 is therefore inhibition of Ferredoxin 1 (FDX1, Accession XM_016467), a gene which tcytochromes P450 involved in steroid, vitamin D, and bile acid metabolism. Accordingly, utilities of VGAM203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FDX1. The function of FDX1 has been established by previous studies. Ferredoxin is a small, acidic, iron–sulfur protein that functions

as an electron transport intermediate for mitochondrial cytochromes P450 involved in steroid, vitamin D, and bile acid metabolism. Electrons are transferred from NADPH through a flavin-containing protein (ferredoxin oxidoreductase) and ferredoxin to the terminal cytochrome P450 for oxidation/reduction reactions. Mitochondrial P450s and their ferredoxin are found mainly in the steroidogenic tissues, including adrenal, ovary, testis, and placenta (Jefcoate et al., 1986). Small amounts of them are also found in the liver and kidney for bile acid and vitamin D synthesis. Because of its relative abundance, the adrenal ferredoxin, designated adrenodoxin, has been characterized in the most detail. It is synthesized as a precursor in which 60 amino acids of the signal peptide are later cleaved upon transport into the mitochondrial inner matrix to form a mature protein of 124 amino acids (Okamura et al., 1985). In almost all human tissues, Morel et al. (1987, 1988) found ADX mRNA in 3 sizes: 1.1, 1.4, and 1.65 kb. Cloning and sequencing of 3 ADX cDNAs showed that the mRNAs of various sizes resulted from alternate polyadenylation sites yielding 3-prime untranslated regions of 229, 530, and 790 bp, respectively. The 540-bp coding region and the 5-prime untranslated re-

gion were identical in all cases. By means of Southern blot analysis of DNA from somatic cell hybrids using stringent conditions of hybridization, 2 chromosomal sites were identified for the ADX gene: chromosomes 11 and 20. One sequence was suspected to represent a processed, intronless pseudogene. Because of the restriction pattern, Morel et al. (1987) suggested that the sequence on chromosome 20 is a pseudogene. Chang et al. (1988) found that the ADX gene spans more than 20 kb and contains 4 exons and 3 introns. The first exon encodes the 60-amino acid signal peptide, which directs transport of the protein into the inner mitochondrial matrix. The mature peptide of 124 amino acids is encoded by the other 3 exons. The third exon encodes the portion of the protein containing the iron-sulfur center and a domain that binds other components of the electron transport chain. By analysis of somatic cell hybrids, Morel et al. (1988) and Chang et al. (1990) assigned the ADX gene to 11q13-qter. Chang et al. (1990) identified pseudogenes on both chromosome 20 and chromosome 21. The pseudogenes lacked introns and contained numerous mutations, including an insertion, deletion, and substitution, which rendered them inactive. They concluded that there are 2 expressed genes, but

only 1 gene product and that both expressed genes are located on chromosome 11. Human adrenodoxin and placental ferredoxin cDNAs share an identical sequence, suggesting that they are the same (Mittal et al., 1988).

Chashchin et al. (1986) found that adrenodoxin is identical in sequence to liver ferredoxin (hepatoredoxin). Renal ferredoxin (renodoxin) has similar optic, renal, and immunochemical properties to adrenodoxin, although Maruya et al. (1983) suggested that the 2 have minor differences. Because they identified only 1 protein sequence, Chang et al. (1990) suggested that there is no need to designate ferredoxin according to the tissue origin. By in situ hybridization, Sparkes et al. (1991) refined the assignment of ADX to 11q22 and demonstrated pseudo-genes on 20q11-q12.

[12998] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12999] Chang, C.-Y.; Wu, D.-A.; Lai, C.-C.; Miller, W. L.; Chung, B.-C. : Cloning and structure of the human adrenodoxin gene. DNA 7: 609-615, 1988. ; and

[13000] Sparkes, R. S.; Klisak, I.; Miller, W. L. : Regional mapping of genes encoding human steroidogenic enzymes:

P450scc to 15q23–q24; adrenodoxin to 11q22; adrenodoxin reductase to 17q24–q2.

[13001] Further studies establishing the function and utilities of FDX1 are found in John Hopkins OMIM database record ID 103260, and in cited publications numbered 4101–410 and 4289–4297 listed in the bibliography section herein–below, which are also hereby incorporated by reference. BCL2–associated Athanogene 3 (BAG3, Accession NM_004281) is another VGAM203 host target gene. BAG3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BAG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAG3 BINDING SITE, designated SEQ ID:10493, to the nucleotide sequence of VGAM203 RNA, herein designated VGAM RNA, also designated SEQ ID:2914.

[13002] Another function of VGAM203 is therefore inhibition of BCL2–associated Athanogene 3 (BAG3, Accession NM_004281). Accordingly, utilities of VGAM203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG3. FLJ21369 (Accession NM_024802) is another VGAM203 host target gene.

FLJ21369 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21369, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21369 BINDING SITE, designated SEQ ID:24183, to the nucleotide sequence of VGAM203 RNA, herein designated VGAM RNA, also designated SEQ ID:2914.

[13003] Another function of VGAM203 is therefore inhibition of FLJ21369 (Accession NM_024802). Accordingly, utilities of VGAM203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21369. MGC19556 (Accession NM_033551) is another VGAM203 host target gene. MGC19556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC19556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC19556 BINDING SITE, designated SEQ ID:27311, to the nucleotide sequence of VGAM203 RNA, herein designated VGAM RNA, also designated SEQ ID:2914.

[13004] Another function of VGAM203 is therefore inhibition of MGC19556 (Accession NM_033551). Accordingly, utilities of VGAM203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC19556. LOC90632 (Accession XM_033067) is another VGAM203 host target gene. LOC90632 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90632 BINDING SITE, designated SEQ ID:31828, to the nucleotide sequence of VGAM203 RNA, herein designated VGAM RNA, also designated SEQ ID:2914.

[13005] Another function of VGAM203 is therefore inhibition of LOC90632 (Accession XM_033067). Accordingly, utilities of VGAM203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90632. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 204 (VGAM204) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[13006] VGAM204 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM204 was detected is described hereinabove with reference to Figs. 1–8.

[13007] VGAM204 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM204 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13008] VGAM204 gene encodes a VGAM204 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM204 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM204 precursor RNA is designated SEQ ID:190, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:190 is located at position 271598 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[13009] VGAM204 precursor RNA folds onto itself, forming

VGAM204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13010] An enzyme complex designated DICER COMPLEX, `dices` the VGAM204 folded precursor RNA into VGAM204 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM204 RNA is designated SEQ ID:2915, and is provided hereinbelow with reference to the sequence listing part.

[13011] VGAM204 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM204 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM204 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13012] VGAM204 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM204 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM204 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM204 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM204 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13013] The complementary binding of VGAM204 RNA, herein designated VGAM RNA, to host target binding sites on VGAM204 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM204 host target RNA into VGAM204 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13014] It is appreciated that VGAM204 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM204 host target genes. The mRNA of each one of this plurality of VGAM204 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM204 RNA, herein designated VGAM RNA, and which when bound by VGAM204 RNA causes inhibition of translation of respective one or more VGAM204 host target proteins.

[13015] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM204 gene, herein designated VGAM GENE, on one or more VGAM204 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13016] It is yet further appreciated that a function of VGAM204 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM204 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM204 correlate with, and may be deduced from, the identity of the host

target genes which VGAM204 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [13017] Nucleotide sequences of the VGAM204 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM204 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM204 are further described hereinbelow with reference to Table 1.
- [13018] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM204 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM204 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [13019] As mentioned hereinabove with reference to Fig. 1, a function of VGAM204 gene, herein designated VGAM is inhibition of expression of VGAM204 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM204 correlate with, and may be deduced from, the identity of the target genes which VGAM204

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13020] Interleukin 1 Receptor Accessory Protein-like 1 (IL1RAPL1, Accession NM_014271) is a VGAM204 host target gene. IL1RAPL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IL1RAPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RAPL1 BINDING SITE, designated SEQ ID:15554, to the nucleotide sequence of VGAM204 RNA, herein designated VGAM RNA, also designated SEQ ID:2915.

[13021] A function of VGAM204 is therefore inhibition of Interleukin 1 Receptor Accessory Protein-like 1 (IL1RAPL1, Accession NM_014271). Accordingly, utilities of VGAM204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RAPL1. LOC197322 (Accession XM_117012) is another VGAM204 host target gene. LOC197322 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC197322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197322 BINDING SITE, designated SEQ ID:43204, to the nucleotide sequence of VGAM204 RNA, herein designated VGAM RNA, also designated SEQ ID:2915.

[13022] Another function of VGAM204 is therefore inhibition of LOC197322 (Accession XM_117012). Accordingly, utilities of VGAM204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197322. LOC51313 (Accession NM_016613) is another VGAM204 host target gene. LOC51313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51313 BINDING SITE, designated SEQ ID:18722, to the nucleotide sequence of VGAM204 RNA, herein designated VGAM RNA, also designated SEQ ID:2915.

[13023] Another function of VGAM204 is therefore inhibition of LOC51313 (Accession NM_016613). Accordingly, utilities of VGAM204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC51313. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 205 (VGAM205) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13024] VGAM205 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM205 was detected is described hereinabove with reference to Figs. 1–8.

[13025] VGAM205 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM205 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13026] VGAM205 gene encodes a VGAM205 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM205 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM205 precursor RNA is designated SEQ ID:191, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:191 is located at position 53165 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[13027] VGAM205 precursor RNA folds onto itself, forming VGAM205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13028] An enzyme complex designated DICER COMPLEX, `dices` the VGAM205 folded precursor RNA into VGAM205 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM205 RNA is designated SEQ ID:2916, and is provided hereinbelow with reference to the sequence

listing part.

[13029] VGAM205 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM205 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM205 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13030] VGAM205 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM205 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM205 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM205 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM205 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13031] The complementary binding of VGAM205 RNA, herein designated VGAM RNA, to host target binding sites on VGAM205 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM205 host target RNA into VGAM205 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13032] It is appreciated that VGAM205 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM205 host target genes. The mRNA of each one of this plurality of VGAM205 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM205 RNA, herein designated VGAM

RNA, and which when bound by VGAM205 RNA causes inhibition of translation of respective one or more VGAM205 host target proteins.

[13033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM205 gene, herein designated VGAM GENE, on one or more VGAM205 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13034] It is yet further appreciated that a function of VGAM205 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM205 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM205 correlate with, and may be deduced from, the identity of the host target genes which VGAM205 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13035] Nucleotide sequences of the VGAM205 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM205 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM205 are further described hereinbelow with reference to Table 1.

[13036] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM205 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM205 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13037] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM205 gene, herein designated VGAM is inhibition of expression of VGAM205 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM205 correlate with, and may be deduced from, the identity of the target genes which VGAM205 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13038] Like-glycosyltransferase (LARGE, Accession NM_004737) is a VGAM205 host target gene. LARGE BINDING SITE1 and LARGE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LARGE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LARGE BINDING SITE1 and LARGE BINDING SITE2, designated SEQ ID:11128 and SEQ ID:28600 respectively, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:2916.

[13039] A function of VGAM205 is therefore inhibition of Like-glycosyltransferase (LARGE, Accession NM_004737), a gene which is a member of the N-acetylglucosaminyltransferase family. Accordingly, utilities

of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LARGE. The function of LARGE has been established by previous studies. Peyrard et al. (1999) investigated the gene content of a segment of 22q12.3–q13.1 that had been shown to contain meningioma-related genes (OMIM Ref. No. 156100) on the basis of studies of deletions. They characterized a new member of the N-acetylglucosaminyltransferase gene family, which they designated the LARGE gene. The LARGE gene spans more than 664 kb of genomic DNA, making it the fifth largest in the human genome, after dystrophin (DMD; 300377), with 2.3 Mb; DCC (OMIM Ref. No. 120470), with 1.4 Mb; GRM8 (OMIM Ref. No. 601116), with 1 Mb; and utrophin (UTRN; 128240), with 900 kb. The LARGE gene contains 16 exons (4,326-bp cDNA) and has an exon content of less than 0.66%, which is similar to the exon content of the DMD gene (0.6%). The chromosomal segment of 22q containing the LARGE gene is apparently poor in genes. By fluorescence in situ hybridization, Peyrard et al. (1999) mapped the mouse Large gene to 8C1 in a region of conserved synteny with 22q12.3–q13.1. The expression pattern of the human and mouse LARGE orthologs is similar. Both

genes are expressed ubiquitously, consistent with their function as housekeeping genes. These genes are also evolutionarily well conserved, as Peyrard et al. (1999) identified an ortholog in *C. elegans* encoding a polypeptide that is 33% identical with the human protein. Michele et al. (2002) demonstrated in both muscle-eye-brain disease (OMIM Ref. No. 253280) and Fukuyama congenital muscular dystrophy (FCMD; 253800) patients that alpha-dystroglycan is expressed at the muscle membrane, but similar hypoglycosylation in the diseases directly abolishes binding activity of dystroglycan for the ligands laminin (see OMIM Ref. No. 150240), neurexin (see OMIM Ref. No. 600565), and agrin (OMIM Ref. No. 103320). Michele et al. (2002) showed that this posttranslational biochemical and functional disruption of alpha-dystroglycan is recapitulated in the muscle and central nervous system of *myd* mice. Michele et al. (2002) demonstrated that *myd* mice have abnormal neuronal migration in the cerebral cortex, cerebellum, and hippocampus, and show disruption of the basal lamina. In addition, *myd* mice reveal that dystroglycan targets proteins to functional sites in brain through its interactions with extracellular matrix proteins. Michele et al. (2002) suggested

that at least 3 mammalian genes function within a convergent posttranslational processing pathway during the biosynthesis of dystroglycan and that abnormal dystroglycan–ligand interactions underlie the pathogenic mechanism of muscular dystrophy with brain abnormalities. Animal model experiments lend further support to the function of LARGE. Michele et al. (2002) demonstrated in both muscle–eye–brain disease (OMIM Ref. No. 253280) and Fukuyama congenital muscular dystrophy (FCMD; 253800) patients that alpha–dystroglycan is expressed at the muscle membrane, but similar hypoglycosylation in the diseases directly abolishes binding activity of dystroglycan for the ligands laminin (see OMIM Ref. No. 150240), neurexin (see OMIM Ref. No. 600565), and agrin (OMIM Ref. No. 103320). Michele et al. (2002) showed that this posttranslational biochemical and functional disruption of alpha–dystroglycan is recapitulated in the muscle and central nervous system of *myd* mice. Michele et al. (2002) demonstrated that *myd* mice have abnormal neuronal migration in the cerebral cortex, cerebellum, and hippocampus, and show disruption of the basal lamina. In addition, *myd* mice reveal that dystroglycan targets proteins to functional sites in brain through its interactions with ex–

tracellular matrix proteins. Michele et al. (2002) suggested that at least 3 mammalian genes function within a convergent posttranslational processing pathway during the biosynthesis of dystroglycan and that abnormal dystroglycan–ligand interactions underlie the pathogenic mechanism of muscular dystrophy with brain abnormalities.

[13040] It is appreciated that the abovementioned animal model for LARGE is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[13041] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13042] Grewal, P. K.; Holzfeind, P. J.; Bittner, R. E.; Hewitt, J. E. : Mutant glycosyltransferase and altered glycosylation of alpha-dystroglycan in the myodystrophy mouse. *Nature Genet.* 28: 151–154, 2001. ; and

[13043] Michele, D. E.; Barresi, R.; Kanagawa, M.; Saito, F.; Cohn, R. D.; Satz, J. S.; Dollar, J.; Nishino, I.; Kelley, R. I.; Somer, H.; Straub, V.; Mathews, K. D.; Moore, S. A.; Campbell, K.

[13044] Further studies establishing the function and utilities of LARGE are found in John Hopkins OMIM database record ID 603590, and in cited publications numbered 1271 and

5843 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0895 (Accession XM_166573) is another VGAM205 host target gene. KIAA0895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0895 BINDING SITE, designated SEQ ID:44545, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:2916.

[13045] Another function of VGAM205 is therefore inhibition of KIAA0895 (Accession XM_166573). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0895. MGC13102 (Accession NM_032323) is another VGAM205 host target gene. MGC13102 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC13102 BINDING SITE, designated SEQ ID:26133, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:2916.

[13046] Another function of VGAM205 is therefore inhibition of MGC13102 (Accession NM_032323). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13102. SCDGF-B (Accession NM_033135) is another VGAM205 host target gene. SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SCDGF-B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2, designated SEQ ID:26981 and SEQ ID:24879 respectively, to the nucleotide sequence of VGAM205 RNA, herein designated VGAM RNA, also designated SEQ ID:2916.

[13047] Another function of VGAM205 is therefore inhibition of SCDGF-B (Accession NM_033135). Accordingly, utilities of VGAM205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCDGF-B.

Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 206 (VGAM206) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13048] VGAM206 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM206 was detected is described hereinabove with reference to Figs. 1–8.

[13049] VGAM206 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM206 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13050] VGAM206 gene encodes a VGAM206 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM206 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM206 precursor RNA is designated SEQ ID:192, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:192 is

located at position 273179 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[13051] VGAM206 precursor RNA folds onto itself, forming VGAM206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13052] An enzyme complex designated DICER COMPLEX, `dices` the VGAM206 folded precursor RNA into VGAM206 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM206 RNA is designated SEQ ID:2917, and is provided hereinbelow with reference to the sequence listing part.

[13053] VGAM206 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM206 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM206 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13054] VGAM206 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM206 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM206 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM206 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM206 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[13055] The complementary binding of VGAM206 RNA, herein designated VGAM RNA, to host target binding sites on VGAM206 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM206 host target RNA into VGAM206 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13056] It is appreciated that VGAM206 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM206 host target genes. The mRNA of each one of this plurality of VGAM206 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM206 RNA, herein designated VGAM RNA, and which when bound by VGAM206 RNA causes in-

hibition of translation of respective one or more VGAM206 host target proteins.

[13057] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM206 gene, herein designated VGAM GENE, on one or more VGAM206 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13058] It is yet further appreciated that a function of VGAM206 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM206 include diagnosis, prevention and

treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM206 correlate with, and may be deduced from, the identity of the host target genes which VGAM206 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [13059] Nucleotide sequences of the VGAM206 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM206 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM206 are further described hereinbelow with reference to Table 1.
- [13060] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM206 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM206 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [13061] As mentioned hereinabove with reference to Fig. 1, a function of VGAM206 gene, herein designated VGAM is

inhibition of expression of VGAM206 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM206 correlate with, and may be deduced from, the identity of the target genes which VGAM206 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13062] Acid Phosphatase, Testicular (ACPT, Accession NM_080789) is a VGAM206 host target gene. ACPT BINDING SITE1 and ACPT BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ACPT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACPT BINDING SITE1 and ACPT BINDING SITE2, designated SEQ ID:28044 and SEQ ID:28047 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13063] A function of VGAM206 is therefore inhibition of Acid Phosphatase, Testicular (ACPT, Accession NM_080789). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACPT. V-akt Murine Thymoma Viral Onco-

gene Homolog 1 (AKT1, Accession NM_005163) is another VGAM206 host target gene. AKT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKT1 BINDING SITE, designated SEQ ID:11655, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13064] Another function of VGAM206 is therefore inhibition of V-akt Murine Thymoma Viral Oncogene Homolog 1 (AKT1, Accession NM_005163), a gene which Serine-threonine protein kinase. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKT1. The function of AKT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM188.UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 3 (B3GNT3, Accession NM_014256) is another VGAM206 host target gene. B3GNT3 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by B3GNT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GNT3 BINDING SITE, designated SEQ ID:15532, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13065] Another function of VGAM206 is therefore inhibition of UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 3 (B3GNT3, Accession NM_014256). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GNT3. Beta-site APP-cleaving Enzyme (BACE, Accession NM_138971) is another VGAM206 host target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BACE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, designated SEQ ID:29088 and SEQ ID:14420 respectively,

to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13066] Another function of VGAM206 is therefore inhibition of Beta-site APP-cleaving Enzyme (BACE, Accession NM_138971), a gene which is responsible for the proteolytic processing of the amyloid precursor protein. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACE. The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. CD34 Antigen (CD34, Accession NM_001773) is another VGAM206 host target gene. CD34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD34 BINDING SITE, designated SEQ ID:7536, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13067] Another function of VGAM206 is therefore inhibition of CD34 Antigen (CD34, Accession NM_001773), a gene

which is a monomeric cell surface antigen that is selectively expressed on human hematopoietic progenitor cells. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD34. The function of CD34 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. CD53 Antigen (CD53, Accession NM_000560) is another VGAM206 host target gene. CD53 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD53, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD53 BINDING SITE, designated SEQ ID:6170, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13068] Another function of VGAM206 is therefore inhibition of CD53 Antigen (CD53, Accession NM_000560). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD53. Centromere Protein B, 80kDa (CENPB, Accession XM_045451) is another VGAM206 host target

gene. CENPB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENPB BINDING SITE, designated SEQ ID:34464, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13069] Another function of VGAM206 is therefore inhibition of Centromere Protein B, 80kDa (CENPB, Accession XM_045451), a gene which is the major centromere antigen. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENPB. The function of CENPB has been established by previous studies. The structure and function of the centromere regions of mitotic chromosomes have been of interest to cell biologists, geneticists and rheumatologists. Cell biologists focus on the centromere as both the site of sister chromatid pairing and the site of mitotic spindle attachment. The latter site, the kinetochore, is a trilaminar plaque structure embedded in the chromatin at the surface of the chromosome, as visu-

alized by electron microscopy. Geneticists have been interested in centromeric sequences involved in the control of chromosomal segregation. Rheumatologists became interested in centromere structure when it was observed that centromere compounds are the target of autoimmune responses. Earnshaw et al. (1987) isolated a series of overlapping DNA clones for about 95% of the mRNA that encodes the B centromeric protein. Anticentromere antibodies recognize 3 antigens: CENPA (17 kD; 117139), CENPB (80 kD), and CENPC (140 kD; 117141). CENPB is considered the major centromere antigen since antibody to it is consistently present at high titer in serum positive for anticentromere antibodies. The B protein is the product of a 2.9-kb mRNA that is encoded by a single locus. By optimizing the primer-annealing temperature in a rapid air cycling procedure, Sugimoto et al. (1993) specifically amplified human DNA sequences encoding CENPB and CENPC, without any detectable amplification of highly homologous rodent DNA sequences. Using a panel of rodent/human hybrid DNAs, the human CENPB and CENPC genes were mapped to chromosomes 20 and 12, respectively. By fluorescence in situ hybridization, Seki et al. (1994) assigned the CENPB gene to 20p13.

[13070] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13071] Earnshaw, W. C.; Sullivan, K. F.; Machlin, P. S.; Cooke, C. A.; Kaiser, D. A.; Pollard, T. D.; Rothfield, N. F.; Cleveland, D. W. : Molecular cloning of cDNA for CENP-B, the major human centromere autoantigen. J. Cell Biol. 104: 817-829, 1987. ; and

[13072] Seki, N.; Saito, T.; Kitagawa, K.; Masumoto, H.; Okazaki, T.; Hori, T.-A. : Mapping of the human centromere protein B gene (CENPB) to chromosome 20p13 by fluorescence in situ hybridizat.

[13073] Further studies establishing the function and utilities of CENPB are found in John Hopkins OMIM database record ID 117140, and in cited publications numbered 4671-4673 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Deleted In Azoospermia (DAZ, Accession NM_004081) is another VGAM206 host target gene. DAZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of DAZ BINDING SITE, designated SEQ ID:10284, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13074] Another function of VGAM206 is therefore inhibition of Deleted In Azoospermia (DAZ, Accession NM_004081), a gene which may play a role in the germ-cell-specific patterns of RNA splicing and storage. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAZ. The function of DAZ has been established by previous studies. Cooke et al. (1996) postulated that the DAZ gene product may play a role in the germ-cell-specific patterns of RNA splicing and storage. They isolated the mouse homolog of DAZ and mapped it by fluorescence in situ hybridization to chromosome 17 at position 25.6 cM. Cooke et al. (1996) reported that the predicted protein product of the mouse homolog is highly homologous to that of the human gene. By RT-PCR analysis, they established that transcripts occur only in mouse germ cells. Deletions of the azoospermia factors on the Y chromosome long arm are an important cause of male infertility, and they may involve germ cell-specific genes or ubiquitously expressed

genes. Foresta et al. (2001) hypothesized that microdeletions involving genes specifically expressed in germ cells should not alter Sertoli cell function. To examine this, they evaluated the testicular hormonal function in infertile patients affected by severe testiculopathies with and without Yq microdeletions, with particular emphasis on Sertoli cell function. They studied 102 well-characterized infertile patients; 27 had Yq microdeletions, and 75 were classified as idiopathic infertiles. Patients with Yq microdeletions had lower FSH (see OMIM Ref. No. 136530) and higher inhibin B (see OMIM Ref. No. 147290) plasma concentrations compared to patients without microdeletions, suggesting that Sertoli cell function in Yq-deleted men is only partially altered. Furthermore, patients with deletions involving germ cell-specific genes had higher concentrations of inhibin B compared to patients with deletions of ubiquitously expressed genes. The authors inferred that a specific alteration of germ cells only partially influences Sertoli cell function. The hormonal status of patients without deletions suggested that in such cases the cause of the spermatogenic defect may have damaged both Sertoli and germ cells. Inhibin B production in patients with Yq deletions was about 70% higher than in nondeleted pa-

tients, and the functional relationship between FSH and inhibin B was normally preserved.

[13075] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13076] Cooke, H. J.; Lee, M.; Kerr, S.; Ruggiu, M. : A murine homologue of the human DAZ gene is autosomal and expressed only in male and female gonads. Hum. Molec. Genet. 5: 513–516, 1996. ; and

[13077] Foresta, C.; Bertella, A.; Moro, E.; Roverato, A.; Merico, M.; Ferlin, A. : Sertoli cell function in infertile patients with and without microdeletions of the azoospermia factors on th.

[13078] Further studies establishing the function and utilities of DAZ are found in John Hopkins OMIM database record ID 400003, and in cited publications numbered 8236–8238, 8234, 8239–8242, 8246–8245, 880 and 8826 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Deleted In Azoospermia-like (DAZL, Accession XM_042839) is another VGAM206 host target gene. DAZL BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DAZL, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAZL BINDING SITE, designated SEQ ID:33800, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13079] Another function of VGAM206 is therefore inhibition of Deleted In Azoospermia-like (DAZL, Accession XM_042839), a gene which may be essential for gametogenesis. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAZL. The function of DAZL has been established by previous studies. Yen et al. (1996) reported the isolation of a human gene homolog of the mouse Dazla gene by screening of a testis-specific library with a DAZ cDNA clone. The gene they isolated contained only 1 of 7 repeats found in DAZ, showed a high degree of homology to the mouse Dazla gene, and mapped to chromosome 3p24. RBM and DAZ/SPGY are 2 families of genes located on the Y chromosome that encode proteins containing RNA-binding motifs, and both have been described as candidate human spermatogenesis genes. Neither gene family had been shown to be es-

essential for spermatogenesis in human males, but a Dazla homolog in *Drosophila* is essential for spermatogenesis (Eberhart et al., 1996). With a polyclonal antibody raised in rabbits against Dazla and with knockout technology in mice, Rugglu et al. (1997) demonstrated that the Dazla protein is cytoplasmic in male and female germ cells, unlike the nuclear RBM protein. Disruption of the Dazla gene led to loss of germ cells and complete absence of gamete production, demonstrating that Dazla is essential for the differentiation of germ cells.

[13080] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13081] Yen, P. H.; Chai, N. N.; Salido, E. C. : The human autosomal gene DAZLA: testis specificity and a candidate for male infertility. *Hum. Molec. Genet.* 5: 2013–2017, 1996. ; and

[13082] Rugglu, M.; Speed, R.; Taggart, M.; McKay, S. J.; Kilanowski, F.; Saunders, P.; Derin, J.; Cooke, H. J. : The mouse Dazla gene encodes a cytoplasmic protein essential for gametogenesis.

[13083] Further studies establishing the function and utilities of DAZL are found in John Hopkins OMIM database record ID

601486, and in cited publications numbered 8236–683 and 8245–6835 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Diacylglycerol O–acyltransferase Homolog 2 (mouse) (DGAT2, Accession NM_032564) is another VGAM206 host target gene. DGAT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DGAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGAT2 BINDING SITE, designated SEQ ID:26294, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13084] Another function of VGAM206 is therefore inhibition of Diacylglycerol O–acyltransferase Homolog 2 (mouse) (DGAT2, Accession NM_032564). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGAT2. Discs, Large (Drosophila) Homolog 4 (DLG4, Accession NM_001365) is another VGAM206 host target gene. DLG4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DLG4, corre–

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG4 BINDING SITE, designated SEQ ID:7047, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13085] Another function of VGAM206 is therefore inhibition of Discs, Large (Drosophila) Homolog 4 (DLG4, Accession NM_001365), a gene which is a membrane-associated guanylate kinase and may intervene in synaptogenesis. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG4. The function of DLG4 has been established by previous studies. Neuregulins and their receptors, the ERBB protein tyrosine kinases, are essential for neuronal development, but their functions in the adult central nervous system are unknown. Huang et al. (2000) reported that ERBB4 (OMIM Ref. No. 600543) is enriched in the postsynaptic density and associates with PSD95. Heterologous expression of PSD95 enhanced NRG (OMIM Ref. No. 142445) activation of ERBB4 and MAP kinase (see OMIM Ref. No. 176948). Conversely, inhibiting expression of PSD95 in neurons attenuated NRG-mediated activation

of MAP kinase. PSD95 formed a ternary complex with 2 molecules of ERBB4, suggesting that PSD95 facilitates ERBB4 dimerization. Finally, NRG suppressed induction of long-term potentiation in the hippocampal CA1 region without affecting basal synaptic transmission. Thus, NRG signaling may be synaptic and regulated by PSD95. Huang et al. (2000) concluded that a role of NRG signaling in the adult central nervous system may be modulation of synaptic plasticity. El-Husseini et al. (2002) identified palmitate cycling on PSD95 at the synapse and found that palmitate turnover on PSD95 is regulated by glutamate receptor activity. Acutely blocking palmitoylation dispersed synaptic clusters of PSD95 and caused a selective loss of synaptic AMPA receptors (e.g., GRIA1; 138248). The authors also found that rapid glutamate-mediated AMPA receptor internalization requires depalmitoylation of PSD95. In a nonneuronal model system, clustering of PSD95, stargazin (OMIM Ref. No. 602911), and AMPA receptors was also regulated by ongoing palmitoylation of PSD95 at the plasma membrane. El-Husseini et al. (2002) concluded that palmitate cycling on PSD95 can regulate synaptic strength and activity-dependent plasticity.

[13086] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [13087] Huang, Y. Z.; Won, S.; Ali, D. W.; Wang, Q.; Tanowitz, M.; Du, Q. S.; Pelkey, K. A.; Yang, D. J.; Xiong, W. C.; Salter, M. W.; Mei, L. : Regulation of neuregulin signaling by PSD-95 interacting with ErbB4 at CNS synapses. *Neuron* 26: 443–455, 2000. ; and
- [13088] El-Husseini, A. E.-D.; Schnell, E.; Dakoji, S.; Sweeney, N.; Zhou, Q.; Prange, O.; Gauthier-Campbell, C.; Aguilera-Moreno, A.; Nicoll, R. A.; Bredt, D. S. : Synaptic strength regulated.
- [13089] Further studies establishing the function and utilities of DLG4 are found in John Hopkins OMIM database record ID 602887, and in cited publications numbered 5327–532 and 11573–5334 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Egl Nine Homolog 3 (*C. elegans*) (EGLN3, Accession NM_022073) is another VGAM206 host target gene. EGLN3 BINDING SITE1 and EGLN3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EGLN3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of EGLN3 BINDING SITE1 and EGLN3 BINDING SITE2, designated SEQ ID:22619 and SEQ ID:27198 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13090] Another function of VGAM206 is therefore inhibition of Egl Nine Homolog 3 (*C. elegans*) (EGLN3, Accession NM_022073), a gene which is an essential component of the pathway. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN3. The function of EGLN3 has been established by previous studies. In cultured mammalian cells, Bruick and McKnight (2001) found that the inappropriate accumulation of HIF caused by forced expression of the HIF1-alpha subunit under normoxic conditions was attenuated by coexpression of HPH. Suppression of HPH in cultured *Drosophila melanogaster* cells by RNA interference resulted in elevated expression of the hypoxia-inducible gene LDH (see OMIM Ref. No. 150000) under normoxic conditions. Bruick and McKnight (2001) concluded that HPH is an essential component of the pathway through which cells sense oxygen. HIF is a transcriptional complex that plays a central role in mam-

malian oxygen homeostasis. Posttranslational modification by prolyl hydroxylation is a key regulatory event that targets HIF- α (HIF1; 603348) subunits for proteasomal destruction via the von Hippel-Lindau (VHL; 193300) ubiquitylation complex. Epstein et al. (2001) defined a conserved HIF-VHL-prolyl hydroxylase pathway in *C. elegans* and identified Egl9 as a dioxygenase that regulates HIF by prolyl hydroxylation. In mammalian cells, they showed that the HIF-prolyl hydroxylases are represented by 3 proteins with a conserved 2-histidine-1-carboxylate iron coordination motif at the catalytic site. The genes encoding these proteins were cloned and termed PHD1 (OMIM Ref. No. 606424), PHD2 (OMIM Ref. No. 606425), and PHD3 by the authors. Direct modulation of recombinant enzyme activity by graded hypoxia, iron chelation, and cobaltous ions mirrored the characteristics of HIF induction in vivo, fulfilling requirements for these enzymes being oxygen sensors that regulate HIF.

[13091] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13092] Bruick, R. K.; McKnight, S. L. : A conserved family of prolyl-4-hydroxylases that modify HIF. *Science* 294:

1337–1340, 2001. ; and

[13093] Epstein, A. C. R.; Gleadle, J. M.; McNeill, L. A.; Hewitson, K. S.; O'Rourke, J.; Mole, D. R.; Mukherji, M.; Metzen, E.; Wilson, M. I.; Dhanda, A.; Tian, Y.-M.; Masson, N.; Hamilton, D.

[13094] Further studies establishing the function and utilities of EGLN3 are found in John Hopkins OMIM database record ID 606426, and in cited publications numbered 4543–4544 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fucosyltransferase 9 (alpha (1,3) Fucosyltransferase) (FUT9, Accession XM_042167) is another VGAM206 host target gene. FUT9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUT9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT9 BINDING SITE, designated SEQ ID:33700, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13095] Another function of VGAM206 is therefore inhibition of Fucosyltransferase 9 (alpha (1,3) Fucosyltransferase)

(FUT9, Accession XM_042167), a gene which catalyzes alpha-1,3 glycosidic linkages. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT9. The function of FUT9 has been established by previous studies. FUT9 is one of several alpha-3-fucosyltransferases that can catalyze the last step in the biosynthesis of Lewis antigen, the addition of a fucose to precursor polysaccharides. FUT9 synthesizes the LeX oligosaccharide, which is expressed in organ buds progressing in mesenchyma during human embryogenesis.

[13096] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13097] Cailleau-Thomas, A.; Coullin, P.; Candelier, J.-J.; Balanzino, L.; Mennesson, B.; Oriol, R.; Mollicone, R. : FUT4 and FUT9 genes are expressed early in human embryogenesis. *Glycobiology* 10: 789-802, 2000. ; and

[13099] Further studies establishing the function and utilities of

FUT9 are found in John Hopkins OMIM database record ID 606865, and in cited publications numbered 83 and 5581–5582 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.UDP–N–acetyl–alpha–D–galactosamine:polypeptide N–acetylgalactosaminyltransferase 2 (GalNAc–T2) (GALNT2, Accession NM_004481) is another VGAM206 host target gene. GALNT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GALNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT2 BINDING SITE, designated SEQ ID:10798, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13100] Another function of VGAM206 is therefore inhibition of UDP–N–acetyl–alpha–D–galactosamine:polypeptide N–acetylgalactosaminyltransferase 2 (GalNAc–T2) (GALNT2, Accession NM_004481), a gene which catalyzes the initial reaction in o–linked oligosaccharide biosynthesis. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associ–

ated with GALNT2. The function of GALNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM187. G Protein-coupled Receptor 63 (GPR63, Accession NM_030784) is another VGAM206 host target gene. GPR63 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPR63, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR63 BINDING SITE, designated SEQ ID:25079, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13101] Another function of VGAM206 is therefore inhibition of G Protein-coupled Receptor 63 (GPR63, Accession NM_030784), a gene which transduces extracellular signals through heterotrimeric G proteins. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR63. The function of GPR63 has been established by previous studies. Using degenerate primers designed from sequence conserved between *Xenopus* and mouse PSP24

homologs, Kawasaki et al. (2000) cloned GPR63, which they called PSP24B, by PCR followed by RACE using human brain mRNA as template. The deduced 419–amino acid protein shares 57% identity with *Xenopus* PSP24 and 92% identity with the mouse homolog. Lee et al. (2001) identified GPR63 within a human genomic DNA library using GPR61 (OMIM Ref. No. 606916) as probe. Primers to the intronless sequence were synthesized, and GPR63 cDNA was amplified by PCR and cloned. Northern blot analysis revealed expression of a single 6.8–kb transcript in various brain regions, with stronger expression in caudate and thalamus, and fainter expression in hypothalamus and midbrain. Kawasaki et al. (2000) cloned mouse *Gpr63*, which they called mPSP24B, by screening a mouse genomic library with the cDNA fragment of *Xenopus* PSP24. The 6.0–kb mouse transcript was expressed almost exclusively in brain. In situ hybridization of mouse brain sections revealed expression in neuronal cells such as olfactory mitral cells, cortical neurons, hippocampal pyramidal cells, and Purkinje cells in the cerebellum. Kawasaki et al. (2000) noted that *Xenopus* PSP24 was originally identified as a lysophosphatidic acid receptor (LPA). Functional analysis of mouse *Gpr63* transfected into

a rat hepatoma cell line suggested that the mouse protein does not function as an LPA receptor.

[13102] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13103] Kawasaki, Y.; Kume, K.; Nakade, S.; Haga, H.; Izumi, T.; Shimizu, T. : Brain-specific expression of novel G-protein-coupled receptors, with homologies to Xenopus PSP24 and human GPR45. Biochem. Biophys. Res. Commun. 276: 952-956, 2000. ; and

[13104] Lee, D. K.; George, S. R.; Cheng, R.; Nguyen, T.; Liu, Y.; Brown, M.; Lynch, K. R.; O'Dowd, B. F. : Identification of four novel human G protein-coupled receptors expressed in the brain.

[13105] Further studies establishing the function and utilities of GPR63 are found in John Hopkins OMIM database record ID 606915, and in cited publications numbered 5501-5503 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate Receptor, Metabotropic 6 (GRM6, Accession NM_000843) is another VGAM206 host target gene. GRM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRM6,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM6 BINDING SITE, designated SEQ ID:6512, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13106] Another function of VGAM206 is therefore inhibition of Glutamate Receptor, Metabotropic 6 (GRM6, Accession NM_000843). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM6. Guanylate Cyclase 1, Soluble, Alpha 3 (GUCY1A3, Accession XM_032838) is another VGAM206 host target gene. GUCY1A3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GUCY1A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GUCY1A3 BINDING SITE, designated SEQ ID:31780, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13107] Another function of VGAM206 is therefore inhibition of Guanylate Cyclase 1, Soluble, Alpha 3 (GUCY1A3, Acces-

sion XM_032838), a gene which is alpha 1 (alpha 3) subunit of soluble guanylate cyclase and forms a heterodimer with GUCY1B3 that converts GTP to cGMP. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GUCY1A3. The function of GUCY1A3 has been established by previous studies. Cyclic GMP (cGMP) plays an important role as an intracellular messenger. The diverse array of its functions includes a central role in phototransduction and in platelet function. Synthesis of cGMP is catalyzed by guanylyl cyclase which exists in soluble and particulate isoforms. Soluble guanylyl cyclase is a dimer composed of a large (alpha) and a small (beta) subunit. Both subunits, alpha-3 and beta-3, were cloned from human brain by Giuli et al. (1992). They found that the alpha-3 and beta-3 subunits are of 82 kD and 70 kD, respectively. Giuli et al. (1993) used the cDNAs coding for these 2 subunits to identify the chromosomal location of the corresponding genes by in situ hybridization. Each probe gave a strong specific signal on chromosome 4 at the 4q31.3-q33 region, with the maximal signal in the 4q32 band. The colocalization of these genes may be related to the coordinated regulation of their expression.

- [13108] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [13109] Giuili, G.; Roechel, N.; Scholl, U.; Mattei, M.-G.; Guellaen, G. : Colocalization of the genes coding for the alpha-3 and beta-3 subunits of soluble guanylyl cyclase to human chromosome 4 at q31.3-q33. Hum. Genet. 91: 257-260, 1993. ; and
- [13110] Giuili, G.; Scholl, U.; Bulle, F.; Guellaen, G. : Molecular cloning of the cDNAs coding for the two subunits of soluble guanylyl cyclase from human brain. FEBS Lett. 304: 83-88, 1992.
- [13111] Further studies establishing the function and utilities of GUCY1A3 are found in John Hopkins OMIM database record ID 139396, and in cited publications numbered 298 and 3571 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glycophorin A (includes MN blood group) (GYPA, Accession XM_113439) is another VGAM206 host target gene. GYPA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GYPA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of GYPA BINDING SITE, designated SEQ ID:42264, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13112] Another function of VGAM206 is therefore inhibition of Glycophorin A (includes MN blood group) (GYPA, Accession XM_113439), a gene which determines the M or N blood group. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GYPA. The function of GYPA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM145. Homeo Box A7 (HOXA7, Accession NM_006896) is another VGAM206 host target gene. HOXA7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXA7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXA7 BINDING SITE, designated SEQ ID:13772, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13113] Another function of VGAM206 is therefore inhibition of Homeo Box A7 (HOXA7, Accession NM_006896), a gene which provides cells with specific positional identities on the anterior–posterior axis. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXA7. The function of HOXA7 has been established by previous studies. The homeotic genes, whose products serve as determinants of embryonic cell fate, are expressed in a series of different but partially overlapping domains that extend along the anterior–posterior (A–P) axis of the embryo. The Hox genes share a 180–bp homeo box, which encodes a 60–amino acid homeodomain that binds specifically to DNA. There are 4 Hox gene clusters: HOXA (formerly HOX1) on chromosome 7, HOXB (formerly HOX2) on chromosome 17, HOXC (formerly HOX3) on chromosome 12, and HOXD (formerly HOX4) on chromosome 2. By sequence comparison, the genes of each cluster are assigned to 1 of 13 groups. The order of the HOX genes along the chromosome reflects where they are expressed along the body axis. This principle is followed in homeo box gene nomenclature. For a review of homeo box gene nomenclature, see Scott (1992). The homeo box is a

180-bp DNA sequence conserved in *Drosophila* homeotic genes which regulate early development (review by Gehring, 1985). These DNA sequences are present in open reading frames and have been identified in *Drosophila* and *Xenopus* embryos. They share structural features with genes encoding some DNA-binding proteins. Homologous homeo box sequences have been detected in species ranging from insects and annelids to vertebrates. The high degree of sequence conservation (70 to 90%) suggests a common role in embryonic development.

Schughart et al. (1989) pointed to evidence of duplication of large genomic regions during evolution of the mouse homeo box genes. The findings were considered consistent with the hypothesis of Ohno (1970) that during vertebrate evolution duplications of the entire genome occurred. Such are likely to be less deleterious than duplications of individual chromosomes. Ferguson-Smith et al. (1989) showed that the sequence of the HOX1 gene has 100% identity to the deduced amino acid sequence of the mouse HOX1.4 homeo box. They detected no RFLPs with the 14-kD clone, which was devoid of any moderately repetitive DNA sequences. This implied an inability of this region to tolerate change in sequence, consistent with a

function highly conserved throughout evolution. Animal model experiments lend further support to the function of HOXA7. As reviewed by Gaunt and Singh (1990), in both the mouse and *Drosophila*, Antennapedia-like homeobox-containing genes (homeogenes) display a strict correspondence between the order of genes (3-prime to 5-prime) along the chromosome and the order of their expression domains (anterior to posterior) in the developing embryo. Gaunt and Singh (1990) suggested that this and other points of similarity indicate that the 2 species use a common mechanism of chromosomal imprinting in order to retain cellular memory of homeogene expression patterns throughout embryonic development. The 'open for transcription' model suggests that imprinting is a matter of open and closed chromatin, the molecular nature of which is not clear. It is possible that a clue to the mechanism of memory used within the homeogene complex, at least in *Drosophila*, is provided by the *Drosophila* mutant 'Polycomb' (Pc). The product of the Pc gene, which presumably has a homolog in man, appears to act as a repressor of 'posterior' genes in anterior segments. Thus, it may be involved in restricting the state of 'openness' of the homeotic gene complex.

- [13114] It is appreciated that the abovementioned animal model for HOXA7 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.
- [13115] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [13116] Schughart, K.; Kappen, C.; Ruddle, F. H. : Duplication of large genomic regions during the evolution of vertebrate homeobox genes. Proc. Nat. Acad. Sci. 86: 7067–7071, 1989. ; and
- [13117] Scott, M. P. : Vertebrate homeobox gene nomenclature. (Letter) Cell 71: 551–553, 1992.
- [13118] Further studies establishing the function and utilities of HOXA7 are found in John Hopkins OMIM database record ID 142950, and in cited publications numbered 5207–5221 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Homeo Box C4 (HOXC4, Accession NM_014620) is another VGAM206 host target gene. HOXC4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HOXC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC4 BINDING SITE, designated SEQ ID:15975, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13119] Another function of VGAM206 is therefore inhibition of Homeo Box C4 (HOXC4, Accession NM_014620), a gene which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC4. The function of HOXC4 has been established by previous studies. As reviewed by Acampora et al. (1989), the homeo box region 3, which maps to 12q12-q13, contains at least 7 homeo boxes in 160 kb of DNA. HOX3A is homologous to mouse Hox-3.1; HOX3B to mouse Hox-3.2; HOX3C to mouse Hox-6.1, and HOX3D to mouse Hox-6.2. The order of genes, from 5-prime to 3-prime, is HOX3G, HOX3F, HOX3B, HOX3A, HOX3C, HOX3D, HOX3E (Acampora et al., 1989). Masuda et al. (1991) mapped the feline equivalent to chromosome B4, which shares syntenic homology with human chromosome 12 and mouse chromosome 15. This

gene is also called HOXC8; see HOXC9 (OMIM Ref. No. 142971). Yueh et al. (1998) showed that overexpression of a Hoxc8 transgene causes cartilage defects whose severity depends on transgene dosage. The abnormal cartilage is characterized by an accumulation of proliferating chondrocytes and reduced maturation. Since Hoxc8 is normally expressed in chondrocytes, these results suggested that Hoxc8 continues to regulate skeletal development well beyond pattern formation in a tissue-specific manner, presumably by controlling the progression of cells along the chondrocyte differentiation pathway. They found that Hoxd4 and Hoxc8 appear to act on chondrocyte differentiation in a similar manner. The protein sequences of the 2 share 67% identity within the homeodomain and 50% in the hexapeptide motif but little similarity in the remaining 70% of the molecules. Isl1, which shares no significant sequence similarities with Hoxc8 or Hoxd4, is not associated with abnormalities of skeletal development, implying that the cartilage abnormalities are specifically induced by HOX genes. The capacity of the HOX genes to regulate cartilage differentiation suggests that they may be involved in human chondrodysplasias or other cartilage disorders.

- [13120] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [13121] Simeone, A.; Pannese, M.; Acampora, D.; D'Esposito, M.; Boncinelli, E. : At least three human homeoboxes on chromosome 12 belong to the same transcription unit. *Nucleic Acids Res.* 16: 5379–5390, 1988. ; and
- [13122] Yueh, Y. G.; Gardner, D. P.; Kappen, C. : Evidence for regulation of cartilage differentiation by the homeobox gene *Hoxc-8*. *Proc. Nat. Acad. Sci.* 95: 9956–9961, 1998.
- [13123] Further studies establishing the function and utilities of *HOXC4* are found in John Hopkins OMIM database record ID 142974, and in cited publications numbered 5223 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. *Hippocalcin-like 1* (*HPCAL1*, Accession NM_134421) is another VGAM206 host target gene. *HPCAL1 BINDING SITE* is *HOST TARGET* binding site found in the 5' untranslated region of mRNA encoded by *HPCAL1*, corresponding to a *HOST TARGET* binding site such as *BINDING SITE I*, *BINDING SITE II* or *BINDING SITE III*. Table 2 illustrates the complementarity of the nucleotide sequences of *HPCAL1 BINDING SITE*, designated SEQ ID:28639, to the nucleotide sequence of

VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13124] Another function of VGAM206 is therefore inhibition of Hippocalcin-like 1 (HPCAL1, Accession NM_134421). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCAL1. IRTA2 (Accession NM_031281) is another VGAM206 host target gene. IRTA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRTA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRTA2 BINDING SITE, designated SEQ ID:25298, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13125] Another function of VGAM206 is therefore inhibition of IRTA2 (Accession NM_031281), a gene which binds to the γ region of immunoglobulins gamma low affinity receptor. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRTA2. The function of IRTA2 has been established by previous studies. Chromosomal ab-

normalities involving translocation breakpoints at 1q21–q23 are frequent in B–cell non–Hodgkin lymphoma (see OMIM Ref. No. BCL9; 602597) and multiple myeloma (MM; OMIM Ref. No. 254500). By cloning the breakpoints of a (1;14)(q21;q32) chromosomal translocation in the FR4 multiple myeloma cell line, followed by exon trapping and screening a spleen cDNA library, Hatzivassiliou et al. (2001) obtained cDNAs encoding 3 isoforms of IRTA1 (OMIM Ref. No. 605876) and 4 isoforms of IRTA2. The 3 major IRTA2 mRNA isoforms (ITRA2A, ITRA2B, and ITRA2C) each have their own unique 3–prime untranslated region, and the proteins they encode share a common amino acid sequence until residue 560, including a signal peptide and 6 extracellular Ig–type domains. Sequence analysis predicted that IRTA2A is a 759–amino acid secreted glycoprotein with 8 total extracellular Ig–type domains followed by 13 unique, predominantly polar residues at its C terminus. After the common 560 amino acids, IRTA2B has only 32 additional residues, whose hydrophobicity is compatible with its docking to the plasma membrane via a GPI anchor. The 977–amino acid IRTA2C protein shares the first 746 amino acids with IRTA2A. IRTA2C has a total of 9 extracellular Ig–type domains with

8 potential N-linked glycosylation sites; a 23-residue transmembrane region; and a 104-residue cytoplasmic domain with 3 consensus SH2-binding domains, all of which exhibit features of ITIMs (immune-receptor tyrosine-based inhibition motifs) and are encoded by separate exons. The fourth isoform, IRTA2D, encodes a peptide of 152 amino acids. Northern blot analysis detected 2.8-, 4.4-, 5.3-, and 0.6-kb IRTA2 transcripts in lymph node, spleen, bone marrow, and small intestine, with a preponderance of the IRTA2A isoform. In situ hybridization analysis detected IRTA2 expression in tonsillar germinal center centrocytes, but not in centroblasts, as well as in intraepithelial and interfollicular regions. Nakayama et al. (2001) independently cloned IRTA2, which they called BX-MAS1, by representational difference analysis of genes activated by anti-IgM crosslinking of a human B-cell line. The deduced 977-amino acid protein contains 8 ITIMs and 8 potential N-linked glycosylation sites. Northern blot analysis detected a 6.7-kb transcript and a larger transcript between 14- and 17-kb in B cells 24 to 36 hours after activation. Northern blot analysis of tissues detected expression only in spleen. In situ hybridization analysis demonstrated expression of IRTA2 in the mantle zone of

tonsil tissue but not in germinal center cells

[13126] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13127] Hatzivassiliou, G.; Miller, I.; Takizawa, J.; Palanisamy, N.; Rao, P. H.; Iida, S.; Tagawa, S.; Taniwaki, M.; Russo, J.; Neri, A.; Cattoretti, G.; Clynes, R.; Mendelsohn, C.; Chaganti, R. S. K.; Dalla-Favera, R. : IRTA1 and IRTA2, novel immunoglobulin superfamily receptors expressed in B cells and involved in chromosome 1q21 abnormalities in B cell malignancy. *Immunity* 14: 277–289, 2001. ; and

[13128] Nakayama, Y.; Weissman, S. M.; Bothwell, A. L. M. : BX–MAS1 identifies a cluster of homologous genes differentially expressed in B cells. *Biochem. Biophys. Res. Commun.* 285: 830–837, 2001.

[13129] Further studies establishing the function and utilities of IRTA2 are found in John Hopkins OMIM database record ID 605877, and in cited publications numbered 29 and 7008 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Itchy Homolog E3 Ubiquitin Protein Ligase (mouse) (ITCH, Accession NM_031483) is another VGAM206 host target gene. ITCH BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by ITCH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITCH BINDING SITE, designated SEQ ID:25564, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13130] Another function of VGAM206 is therefore inhibition of Itchy Homolog E3 Ubiquitin Protein Ligase (mouse) (ITCH, Accession NM_031483), a gene which accepts ubiquitin from an e2 ubiquitin-conjugating enzyme in the form of a thioester and then directly transfers the ubiquitin to targeted substrates. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITCH. The function of ITCH has been established by previous studies. Using GST pull-down and coimmunoprecipitation experiments, Winberg et al. (2000) demonstrated that ITCH and KIAA0439 (OMIM Ref. No. 606384) form physiologic complexes with the Epstein-Barr virus (EBV) latent membrane protein 2a (LMP2A) in EBV-positive cells. They concluded that the ability of LMP2A to recognize the WW domains of ITCH or KIAA0439 is dependent on the LMP2A PPPPY motifs. Using

chimeric protein analysis, they determined that the N-terminal region of LMP2A is necessary and sufficient for binding to ITCH and that this interaction is not dependent on tyrosine phosphorylation. The authors hypothesized that LMP2A promotes ITCH-mediated ubiquitination of Lyn (OMIM Ref. No. 165120) and Syk (OMIM Ref. No. 600085). With GST pull-down assays and immunoprecipitation assays, Qiu et al. (2000) demonstrated that Itch binds to the N-terminal portion of the Notch (see OMIM Ref. No. 190198) intracellular domain via its WW domains and promotes ubiquitination of Notch through its HECT ubiquitin ligase domain. They hypothesized that Itch may participate in the regulation of immune responses by modifying Notch-mediated signaling. Using transfection experiments, Chen et al. (2001) concluded that ITCH can act as a transcriptional corepressor of p45/NFE2. The interaction between these 2 proteins is modulated through the WW1 domain of ITCH and requires the PY motif of p45/NFE2. In cotransfection assays, they observed that ITCH suppressed transcriptional activation by p45/NFE2. They hypothesized that the erythroid hyperplasia observed in a18H mice (see OMIM Ref. No. Animal Model section) is likely due to the loss of NFE2/ITCH interaction.

Animal model experiments lend further support to the function of ITCH. By analyzing genomic clones from wild-type and mutant mice, Perry et al. (1998) determined that the phenotype of the non-agouti-lethal 18H (a18H) or Itchy mice results from a small inversion that disrupts both the agouti and the Itch genes. The mice develop a spectrum of immunologic diseases not seen in other mice with mutations in agouti. The phenotype includes inflammation of the lung and stomach, hyperplasia of lymphoid and hematopoietic cells, and constant itching in the skin, suggesting that Itch is involved in the regulation of immune response. The inversion in a18H mice appears to produce a null allele of Itch by removing the promoter from the coding region of the Itch gene. Perry et al. (1998) concluded that the a18H mutation provides a link between ubiquitin-dependent proteolysis and normal immune function in vivo in addition to identifying a molecule important for the regulation of epithelial and hematopoietic cell growth. D'Andrea and Serhan (1998) presented models of how the disruption of the Itch locus may cause the immune reaction seen in a18H mice and discussed the implications for possible functions of Itch

[13131] It is appreciated that the abovementioned animal model

for ITCH is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[13135] Further studies establishing the function and utilities of ITCH are found in John Hopkins OMIM database record ID 606409, and in cited publications numbered 4528–453 and 2569 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Integrin, Alpha 11 (ITGA11, Accession NM_012211) is another VGAM206 host target gene. ITGA11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA11, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA11 BINDING SITE, designated SEQ ID:14514, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13136] Another function of VGAM206 is therefore inhibition of Integrin, Alpha 11 (ITGA11, Accession NM_012211), a gene which acts as a collagen I receptor. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA11. The function of ITGA11 has been established by previous studies. By screening a uterus cDNA library with an integrin-like cDNA fragment isolated from a fetal myoblast cDNA library, Velling et al. (1999) obtained a full-length cDNA sequence encoding integrin alpha-11. ITGA11 encodes a deduced 1,188-amino acid protein, including a 22-amino acid signal peptide. The mature 1,166-amino acid protein contains a 23-amino acid transmembrane region and a 24-amino acid cytoplasmic tail. It differs from most other integrin alpha chains in that the cytoplasmic tail contains the sequence GFFRS instead of the conserved GFFKR sequence. The extracellular do-

main contains 7 FG–GAP repeats with an I domain of 195 amino acids between repeats 2 and 3 that includes a conserved metal ion–dependent adhesion site motif. Twenty cysteines are located in the extracellular domain and there are 16 potential N–glycosylation sites. ITGA11 is 42%, 37%, and 35% identical with I domain alpha–integrins ITGA10 (OMIM Ref. No. 604042), ITGA1 (OMIM Ref. No. 192968), and ITGA2 (OMIM Ref. No. 192974), respectively. Northern blot analysis revealed expression of an approximately 5.5–kb ITGA11 transcript. Expression was highest in uterus, strong in heart, intermediate in skeletal muscle, stomach, small intestine, bladder, prostate, and colon, and low in nonmuscle tissues such as pancreas, kidney, and placenta. The authors found that, in contrast, ITGA1 is not expressed in the uterus. Immunoprecipitation studies and SDS–PAGE analysis showed that ITGA11 encodes a 145–kD protein, intermediate in size between ITGA2 or ITGA10 and ITGA1; the authors suggested that the difference is probably due to differential glycosylation. Like other I domain–containing integrins, ITGA11 binds to collagen. By sequence analysis, Lehnert et al. (1999) found that the deduced ITGA11 protein contains an I domain of 207 amino acids and 15 N–glycosylation sites in a mature

protein of 1167 amino acids. By FISH, Velling et al. (1999) mapped the ITGA11 gene to chromosome 15q23. By somatic cell hybrid analysis and FISH, Lehnert et al. (1999) mapped the gene to 15q22.3–q23.

[13137] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13138] Lehnert, K.; Ni, J.; Leung, E.; Gough, S. M.; Weaver, A.; Yao, W.-P.; Liu, D.; Wang, S.-X.; Morris, C. M.; Krissansen, G. W. : Cloning, sequence analysis, and chromosomal localization of the novel human integrin alpha-11 subunit (ITGA11). *Genomics* 60: 179–187, 1999. ; and

[13139] Velling, T.; Kusche-Gullberg, M.; Sejersen, T.; Gullberg, D. : cDNA cloning and chromosomal localization of human alpha-11 integrin: a collagen-binding, I domain-containing, beta-1-asso.

[13140] Further studies establishing the function and utilities of ITGA11 are found in John Hopkins OMIM database record ID 604789, and in cited publications numbered 2906–2907 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIP2 (Accession NM_006383) is another VGAM206 host target gene. KIP2 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by KIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIP2 BINDING SITE, designated SEQ ID:13089, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13141] Another function of VGAM206 is therefore inhibition of KIP2 (Accession NM_006383). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIP2. Keratin 16 (focal non-epidermolytic palmoplantar keratoderma) (KRT16, Accession XM_170845) is another VGAM206 host target gene. KRT16 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KRT16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KRT16 BINDING SITE, designated SEQ ID:45630, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13142] Another function of VGAM206 is therefore inhibition of

Keratin 16 (focal non-epidermolytic palmoplantar keratoderma) (KRT16, Accession XM_170845). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRT16. Leucine Zipper, Down-regulated In Cancer 1 (LDOC1, Accession NM_012317) is another VGAM206 host target gene. LDOC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LDOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDOC1 BINDING SITE, designated SEQ ID:14693, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.
